Our good friend Pratt, of Marlboro, Mass., has actually succeeded in doing it; yes, even where the bees were missed, so as to be out four or five days, instead of two, and they came through with only two or three dead bees. Full particulars are given in the *American Bee Journal* for Sept. 14. Now, while we are pleased to hear of the success of this experiment, we are greatly troubled, for fear the postal authorities may not only rule out bees by the half-pound, but bees and queens. In fact, queens have been sent us repeatedly in such shape that I would not blame the department for shutting down on us. If friend Pratt is permitted to send half-pounds through the mails, other bee-keepers must of course have the same permission; and perhaps not one in a thousand is as well able to put up their bees as is friend Pratt. I do not exactly see how half a pound of bees can well be put up so that the package may not be smashed by some accident; and one such smash-up would perhaps finish the business for us. As Prof. Cook was instrumental in getting queens through the mails when they were once cut off, I should very much like to know his opinion in regard to the matter. Friend Doolittle, who writes the matter up, as well as the editor of the *American Bee Journal*, do not either one seem to apprehend very much trouble in the matter. Besides, sending this trial package through the mails is, if we are correct, a direct violation of our present laws. We have this week received through the mails a glass bottle containing a full half-pint of honey. It did not get broken, but it is a wonder. Friend Doolittle suggests that the powdered sugar rattling down in the mail-bags would be an objection. So far as that is concerned, grinding the sugar in a paint-mill, or otherwise, so that there are no grains at all, will, I think, fix that part of it. Sugar and honey ground together would be like paint or cream. In that state, I feel sure the bees would eat every particle, both of sugar and honey.

SPECIAL NOTICES.

WINTER ONION-SETS.

These will do nicely if planted now. Price 10c per quart, or 75c per peck. If wanted by mail, send 10c per quart extra.

GRAND RAPIDS LETTUCE.

Now is the time to plant Grand Rapids lettuce in the open ground, so as to have fine strong plants for setting in the greenhouse. It is economy to have them make as much growth as possible outdoors, on account of the comparative cheapness of the ground and the saving in expense of watering, airing, etc. With a little rude protection you can get very nice lettuce Thanksgiving and Christmas from seeds planted in the open ground.

STRAWBERRY-PLANTS IN SEPTEMBER.

Since our bountiful rain we are fully supplied with the very finest, well-rooted strawberry-plants,

grown on our river-bottom. We can furnish Sharples at 10 cts. for 10; 50 cts. per 100, or \$4.00 per 1000; Jersey Queen and Jessie, 10 cts. for 10; 75 cts. per 100, or \$5.00 per 1000. At present writing we place the Jessie ahead of every other strawberry we have ever had, for general purposes. The new Bubach, we have not tested as thoroughly as we have the Jessie; but so far as we have tried it, it gives great promise. Prices of the Bubach, 15 cts. for 10; \$1.00 per 100, or \$7.50 per 1000. The latter is perhaps the largest berry we have ever had any thing to do with; but when ripe it is very soft, and must be handled carefully. By using pint boxes, however, and getting them before customers pretty quickly after they are fully ripe, you can get along very well. If you are having rain, I do not know any better month to set out strawberries than September. We have been obliged to increase the postage on our strawberry plants, because they are so much larger and heavier than any we have ever before raised. If wanted by mail, add 5 cts. extra for 10, or 20 cts. for 100.

DISCOUNTS TO THOSE WHO ORDER GOODS FOR NEXT SEASON'S USE NOW.

According to our usual custom, we offer the following discounts for early orders. The reasons for this are many, and the reasons why you should take advantage of our offer are many more. Our main reason for making the offer is to divert as much as possible of the trade out of the very crowded months of the spring into the fall and winter, and thus equalize business as much as possible. If you know pretty well a large part of your next spring's needs, you should, by all means, anticipate these needs for these reasons, and many more that might be named.

1. It is to your profit, if you have the money to invest, both in the first cost of the goods and in the economy in preparing them for use. You can nail your stuff together more economically in the winter time, when there is not much else to do, than at any other time. Hives painted in the winter will become thoroughly dry by the time you are ready to use them, and will last much longer.

2. By anticipating your needs you can give the goods ample time to reach you by freight. Time and again the past season, customers have sent large orders for goods by express, and said they knew the charges would be high, but they could not wait for freight; they "must have the goods at once." These high charges might have been saved by a little forethought.

3. By ordering early you avoid the danger and worry of having your orders delayed, and the risk of losing a large part of your honey crop thereby. The past season, as near as we have been able to learn, all supply-dealers were more or less behind on their orders. This is no more than should be expected with such an unusual demand. Our goods, from their nature, being bulky, it is manifestly impossible to stock up sufficiently to meet such a demand, and it is also impossible to meet the demand by extra help and machinery, because competent help can not be had in a day, and the extra work must necessarily be of poor quality. The easiest and most sensible way out of the difficulty is for you who know your needs to have them supplied ahead; and if you haven't looked far enough, and should want more goods in the spring in a hurry, we will try to remember how you helped us out, and will in return give you as prompt attention as possible.

We have decided on the following discounts, which are sufficiently liberal to make it a profitable investment for you, and the discounts will apply to every thing in our catalogue ordered for next season's use. They can not, of course, apply to large orders for counter goods or honey-packages; but if only a few of them are included with an order for hives, etc., then the discount may be taken from the whole bill.

Up to November 1st, discount will be 5 per cent. After that date, one per cent a month for each month before March; i. e., 4 per cent in November, 3 per cent in December, 2 per cent in January, and 1 per cent in February. One per cent a month is equal to 12 per cent per annum, and money can be had in most places for 6 and 8 per cent, so that you see that, although our offer is not quite as liberal as formerly, it is still profitable, and we trust that many of you will find it to your advantage to avail yourselves of it. Remember, our discounts for large orders on page 2 of catalogue are applicable in addition to above discounts.

CONVENTION NOTICES.

The American International Bee-keepers' Association will meet in the Court-house, Brantford, Canada, Dec. 4, 5, 6, 1889. All bee-keepers are invited to attend. State and district bee-keepers' societies are invited to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Any one desirous of becoming a member, and receiving the last annual report, bound, may do so by forwarding \$1.00 to the secretary.
R. F. HOLTERMANN, Sec'y.
Brantford, Ont., Can.

The Northwestern Bee-keepers' Society will hold its annual convention at the Commercial Hotel, corner of Lake and Dearborn Sts., Chicago, on Friday and Saturday, Oct. 11 and 12, at 9 A.M. Arrangements have been made with the hotel for back room, one bed, two persons, \$1.75 per day, each; front room, \$2 per day, each person. This date occurs during the exposition, when excursion rates on the railroads will be one fare for the round trip, good from Oct. 10 to 14, inclusive. There has been a fair crop of honey in the West, and an old-time crowd may be expected at this revival of the Northwestern from its "hibernation."
W. Z. HUTCHINSON, Sec'y.

Wants or Exchange Department.

WANTED.—To exchange honey for beeswax. We will take beeswax in exchange for honey in any quantity. Will give three pounds for one. Write for particulars.
CHAS. DADANT & SON,
187dd
Hamilton, Hancock Co., Ill.

WANTED.—To exchange good Italian bees for a good foot-power saw.
W. S. BISEL,
19d
Atchinson, Kansas.

WANTED.—To exchange for honey, a Given fdn. press, with L. size die-book, and wax-boilers and dipping-boards for same. H. D. BURRELL,
Box 386, Bangor, Van Buren Co., Mich.

WANTED.—To exchange 2 canary-bird singers for any thing we can use in our home.
HELENA AND CHARLEY SNYDER, Orion, Wis.

PUBACH, Jessie, Warfield, Hoffman's Seedling, B May King, and Crescent strawberry-plants, cheap, in exchange for comb or extracted honey, sections, or beeswax. Plants true to name.
Write to E. T. FLANAGAN, Belleville,
Box 995, St. Clair Co., Ill.

WANTED.—To exchange 10,000 Cuthbert raspberry-plants, for sections, foundation, or extracted honey. I will give a bargain on the above plants.
19-20d P. D. MILLER, Grapeville, Westm'd Co., Pa.

WANTED.—To sell my hive-factory and bees, or one to take charge of the business. A good chance for one understanding the business. For further information write to
P. L. VIALON, Bayou Goula, La.

WANTED.—To exchange bees, for top-buggy, road-cart, surgical or dental instruments, watch or clock.
DR. CORYA, Moore's Hill, Ind.

WILL exchange Elgin watch for World type-writer. E. HOSTETLER, East Lynne, Cass Co., Mo.

WANTED.—A situation with an apiarist, for any length of time. Will give good reference; will go to any part of the United States. For further particulars address S. W. WHIT, Box 179, Liberty, Mo.

Black and Hybrid Queens For Sale.

A few hybrid queens at 30 cts. each.
M. ISBELL, Norwich, Chenango Co., N. Y.

I have about a dozen mismatched Italian queens, which I will sell at 40c each, by return mail.
J. M. KALE, Newton Falls, Trumbull Co., O.

Twelve black queens, at 25c each. I guarantee satisfaction.
C. H. EHLERS,
Pleasant Valley, Scott Co., Iowa.

I shall have 30 or 40 black queens between this and the first of November, that I will sell at 15c, if any one wants them.
W. T. LYONS,
Decherd, Franklin Co., Tenn.

Italian hybrid queens for sale at 22c each. Young and prolific.
J. H. HONCH,
Middaghs, Northampton Co., Pa.

The Secrets of Success in the Growing of Small Fruits

Gives you the benefit of several years' experience in growing berries for market, together with my illustrated catalogue and price list of berry-plants; sent free on application. Now is the time to set strawberries for next year's fruiting. Jessie, Cloud, and other new varieties. 16-19db

I. A. WOOLL, Elsie, Mich.

In responding to this advertisement mention GLEANINGS.

BEE-KEEPERS AND FRUIT-GROWERS,
Send for my price list of
BEE-KEEPERS' SUPPLIES AND STRAWBERRY-PLANTS.
Twenty-five varieties to select from.
Address F. W. LAMM,
Box 106, SOMERVILLE, - BUTLER CO., OHIO.
18-23db

NOTICE.—I have just received a shipment of imported Carniolan queens from Frank Benton, and the 1st of Oct. look for a shipment from Michael Ambrozic, Austria, Europe.
J. B. KLINE, 924 Kansas Ave., Topeka, Kan.

Crawford's Folding Paper Boxes

For Inclosing Section Honey.

THE BEST BOX FOR THE LEAST MONEY!
\$5.00 Per 1000

and less, according to quantity. Send for sample and price list. A. C. CRAWFORD, S. WEYMOUTH, MASS.
In responding to this advertisement mention GLEANINGS.

HOME EMPLOYMENT.—AGENTS wanted everywhere, for the HOME JOURNAL—a grand family paper at \$1 a year. Big cash premiums. Sample FREE. THOS. G. NEWMAN & SON, 923 & 925 West Madison Street, - CHICAGO, ILLS.

Bees & Poultry

The Canadian Bee Journal and Poultry Weekly is the best paper extant devoted to these specialties. 24 pages, WEEKLY, at \$1.00 per year. Live, practical, interesting. Nothing stale in its columns. Specimen copies free. Subscribers paying in advance are entitled to two insertions of a five-line adv't (40 words) in the Exchange and Mart column.
THE D. A. JONES CO., BEETON, ONTARIO, CAN.

SPECIAL NOTICES.

SPIDER-PLANT SEED WANTED.

Have any of the readers of GLEANINGS any fresh seed for sale? If so, tell us on a postal card how much, and what you want for it, delivered here in Medina.

GILT-EDGE EXTRACTED HONEY.

On another page of this number you will find an illustration of the apiary of F. L. Snyder, Orion, Wisconsin. We have secured from this man over 3000 lbs. of the finest baswood honey we ever tasted. It was produced in the apiary shown; and no man, however skeptical he may be in regard to the manufacture of honey, after tasting this, would call it any thing but pure honey of the best kind. The secret of its being so nice is, that friend S. lets it stand in open barrels and cans for several weeks for it to ripen. As a result, it is so thick it will hardly run. We have also secured from friend Baxter, of Nauvoo, Ill., about 10,000 lbs. of very fine clover extracted honey. We have only the sample here yet; the stock will arrive in a few days. Judging from the sample, we should say it was as good as friend Snyder's. Both lots of honey are in barrels of from 500 to 550 lbs. each; and the price by the barrel is 9c per lb. We will put it into 60-lb. square cans, and ship in lots of 1, 2, or more cans, at 10c per lb. We have some of Snyder's honey in kegs of from 50 to 55 lbs. each, which we will sell at 9½c per lb. We have some choice white comb honey in 20-lb. cases, which we offer at 16c per lb.

REVISED PRICE LIST OF THE DOVETAILED HIVE.

We have revised the table of prices of the Dovetailed hive, which appears below. New prices go into effect from this date. You will notice a slight advance. Having added a price list of parts this was necessary to make things agree. As some have not understood just how to put this hive together, we have made a diagram, with minute instructions, which we give below, and which will also be included with each lot sent out.

DOVETAILED HIVES PUT UP AND IN THE FLAT.

Description.	Price each.	In lots of	Weight of
(Please order by numbers.)		1 5 10	10
No. 1. Eight-frame Dovetailed hive, shown to the left, above, with one bottom, body, one super, with sections, separators, and foundation starters, slatted honey-board, 8 all-wood frames and cover, 1½ story, for comb honey, complete, put up and painted.	1 50	1 45	1 40
No. 1. Eight-frame Dovetailed hive in flat, complete, same as above.	1 20	1 10	1 00
No. 1. Eight-frame Dovetailed hive, in flat, empty, same as above, leaving out sections, separators, and starters.	91	77	72
No. 2. Eight-frame Dovetailed hive, shown to the right, above, is furnished just like No. 1, with one more super added, making a two-story hive complete, put up painted.	2 00	1 95	1 90
No. 2. Eight-fr. Dovetailed hive in flat, complete, as above.	1 51	1 40	1 35
No. 2. Eight-frame, Dovetailed, in flat, empty, same as above, leaving out sections, separators, and starters.	1 10	95	91
No. 3. Same as No. 1, except that it has T tins in the supers, instead of section-holders. Same price.			
No. 4. Same as No. 2, with T tins instead of section-holders. Same price.			

We will make the Dovetailed hive 10-frame instead of 8-frame, in any of above numbers, as follows:
Nailed and painted, complete, 25 cts. each extra.
In flat, complete, 20 cts. each extra.
In flat, empty, 15 cts. each extra.

NAILS SUITABLE FOR ABOVE HIVES.

	Price for	10	25	50	hives.
Nails for No. 1. Dovetailed hive.	10	25	45	2 00	
Nails for No. 2. Dovetailed hive.	10	30	55	2 25	
Nails for Nos. 3 and 4, same as for Nos. 1 and 2 respectively, and for 10-frame same as for 8-fr. hives.					

DISCOUNTS FOR QUANTITY.

For 20 hives, deduct 2 per cent.	For 50 hives, deduct 5 per cent.
For 30 hives, deduct 3 per cent.	For 60 hives, deduct 6 per cent.
For 40 hives, deduct 4 per cent.	For 80 hives, deduct 8 per cent.
For 100 hives or more, deduct 10 per cent.	

TABLE OF PRICES OF PARTS OF DOVETAILED HIVES.

Name	Wt. of 10	Price.	Flat.	Nail'd	Painted.
		1 10	1 10	1 10	1 10
8-fr. Dove'd bottom-board	40 lbs.	10	80	12	1 00
8-fr. Dove'd cover-board	40 lbs.	10	80	12	1 00
8-fr. Dove'd cover, with tin.	50 lbs.	15	30	18	1 60
8-fr. Dove'd body, empty.	70 lbs.	24	2	00	2 50
8-fr. Dove'd super, empty.	35 lbs.	12	1	00	15
10-fr. Dove'd bottom-board	50 lbs.	12	1	00	14
10-fr. Dove'd cover-board	50 lbs.	12	1	00	14
10-fr. Dove'd cover, with tin.	64 lbs.	20	1	00	22
10-fr. Dove'd body, empty.	76 lbs.	20	2	50	35
10-fr. Dove'd super, empty.	38 lbs.	15	1	25	18

For the same quantity of parts the same discount will apply as on complete hives.

DIRECTIONS FOR PUTTING TOGETHER THE DOVETAILED HIVE.

DIAGRAM OF NO. 1 8-FRAME DOVETAILED HIVE.

Drawn to scale of ¾. Fig. 1 is a cross-section through hive the narrowest way. Fig. 2 is a fragment of cross section through lengthwise. *a* is the cover, and *f* the bottom-board. These are plain boards, ¾x13½x21½, the only difference being that the cover is a better board than the bottom; that is, clear of checks and knots; *b* is the cover-board, ¾x13½x13½, grooved ¾x¾. One of these is nailed to each end of the cover, and to the back end of the bottom; *g* is the cleat for the front end of the bottom, ¾x1½x13½, rabbeted ¾x¾; *e* is the side strip for bottom, ¾x¾x21; *c* is the side of the super; *i* is the end. The super measures 4¾x13½x20¼, outside, 11½x18½ inside. Two supers are made by ripping one body in two; *d* and *j* are the side and end of the body, the same size as super, 9½ deep. The rabbet in the top edge of the end of the super and body is ¾ wide by ¾ deep; *h* is the honey-board, consisting of 13 pieces. Two pieces, ¾x13½, rabbeted ¾x¾, form the ends, as shown to the right of *h*. Two pieces, ¾x11½, rabbeted on the ends to fit the rabbet in end-piece; 9 slats, 1½x19½, spaced as shown, and nailed into rabbeted end-piece. This honey-board may be made queen-excluding by making saw-kerfs in the edges of the slats, and sliding in a strip of perforated zinc, as shown at *k*, in drawing of Simplicity hive. *k* is the section-holder, of which this is an illustration of 6 standing side by side. The ends are plain blocks, 1½x1½x4; the bottoms, ¾x1½, slotted as shown. *m*, in Fig. 2, is the tin separator, ¾x18. This is nailed to one side of the section-holder. The section-holders rest on a tin strip, 1½x12, nailed to the bottom inside edge of the end of super, as shown in Fig. 2, to the right of *h*, and between the honey-board and super; *l* is the brood-frame, of which there are 8 to each hive, and which are spaced ½ in. apart, and from each side of

SECTION-HOLDERS FOR THE DOVETAILED HIVE.

hive. They measure 9½x17½ outside; top-bar, 19½. They are ½ wide all around, and top-bar ¾ thick; ends and bottom, ½. A comb-guide, 1x3, is inserted in the top-bar, as shown, to guide the bees, or to attach comb fdn. to. See detailed cut of this frame, page 14 of catalogue.

Eight-frame Dovetailed hive No. 2 is just like No. 1, with another super added.

No. 3, eight-frame Dovetailed, is just like No. 1, except that it has 5 ½ tins to support the sections, instead of 4 the section-holders. No. 4 is like No. 3, with 2 supers instead of one.

Ten-frame hives are arranged just like the eight-frame, but are 16 inches wide outside, have 2 more brood-frames below, and one more section-holder in super.

As two supers are just the same depth as one body, brood-frames may be hung in the supers for extracting, or another body may be used on top the lower one, instead. The bee-space is put in the bottom-board instead of making the body deeper, for various reasons, of which this is the most important. It makes all bodies the same depth, so they can be tiered and interchanged, or split in two for supers, thus simplifying the construction of the hive. It also secures an entrance without cutting it from either body or bottom, thus leaving the bottom and cover boards exactly alike.

No tin rabbits are used in the Dovetailed hive; but the frames hang on a wood bearing. No enameled sheets are included with the Dovetailed hives, as they are not necessary. The cover, no matter where put on, comes just a bee-space above the frames, honey-board, or sections, forming the best covering possible in either case.

No. 1, \$2.00; No. 2, \$1.75; No. 3, \$1.50 | Knife
No. 4, 1.25; No. 5, 1.00; No. 6, 65 | \$1.15

On receipt of the above price

SMOKERS AND KNIVES

will be sent postpaid. Descriptive circulars will be sent on receipt of request card.

Bingham & Hetherington Smokers and Knives are staple tools, and have been used ten years without complaint, and are the only stovewood-burning clear-smoke bee-smokers; no going out, no vexation. Address

HONEY COLUMN.

CITY MARKETS.

KANSAS CITY.—Honey.—Honey is selling very slowly at 14c for 1-lb. white comb, and the prospects are for lower prices. We have been trying to hold the market to 14 and 15c, but parties in Iowa and Illinois are offering and selling white 1-lb. comb at 12@12½c, delivered here and at other points in Kansas. Receipts are large, and in order to sell we shall have to meet these prices. Extracted, steady at 7@8 for white, and 5@6 for amber.—*Beeswax*, 20c. Sept. 14. CLEMONS, CLOON & CO., Kansas City, Mo.

BOSTON.—Honey.—Receipts of honey have been a little in excess of the sales, and there has been a disposition on the part of some to reduce the prices. We quote our market from 16@18c for 1-lb. combs; 16@17 for 2-lbs. Extracted is stronger, and promises to be even higher, the market to-day being from 8@9c. No *beeswax* on hand. Sept. 23. BLAKE & RIPLEY, Boston, Mass.

ST. LOUIS.—Honey.—We quote choice white clover honey, 1-lb. sections, single tier cases, 12, 24, and 32 lb. preferred, 12½@13½c; fancy, 14. Same grades and larger sections, 9@11c. Extracted, white clover, cans, 6½@7c; bbls., 5½@6. Southern, dark, 4½@5; bright, 5@5½. W. B. WESTCOTT & CO., Sept. 13. 320 Main St., St. Louis, Mo.

CINCINNATI.—Honey.—No change in the market since our last. We quote extracted honey at 5@8c on arrival. Comb honey, 11@16c in the jobbing way. Arrivals of extracted honey are good, while choice comb honey arrives in small lots only.—*Beeswax* is in good demand at 20@22c on arrival, for good to choice yellow. CHAS. F. MUTH & SON, Sept. 23. Cincinnati, Ohio.

NEW YORK.—Honey.—Extracted, white clover, basswood, California, and orange bloom, 8@8½c. Comb honey, 1 lb., fancy white, 16c; 1 lb., fair, 14; 2 lb., fancy, 14; 2 lb., fair, 11½; 12; 1 lb., buckwheat, 11@11½; 2 lb., 10@11. Demand is good. We make quick sales and prompt returns. F. G. STROHMEYER & CO., Sept. 23. 122 Water St., New York.

ALBANY.—Honey.—Consumption improving, and receipts not equal to demand at present, especially of buckwheat, or something to sell at 12@13c. White clover, 14@18; mixed, 13@15; buckwheat, 12 13; extracted, clover, 7@8; buckwheat, 5½@6½c. Consignments and correspondence solicited. H. R. WRIGHT, Sept. 25. Albany, N. Y.

KANSAS CITY.—Honey.—Demand good for comb and extracted. Sales large for this time of year. Prices are lower, owing to offerings by bee-keepers. White clover and linn, 1-lb. sections, fancy, 14@15c; good, 13@14; dark, 12; 2-lb. sections, 13@14; dark, 12. Extracted, white, 8; dark, 7c. HAMBLIN & BEARSS, Sept. 27. 514 Walnut St., Kansas City, Mo.

ST. LOUIS.—Honey.—Market quiet. Choice white clover, comb, 12@12½; fair, 10@11; dark, 7@7½. Extracted and strained, bright, good flavor, 5½; dark, 5@5½; in cans, bright, 7@7½. D. G. TUTT GRO. CO., Sept. 23. St. Louis, Mo.

FOR SALE.—9000 lbs. of honey, in scant 1-lb. sections, crates holding 12 sections; will take 13c for white clover, and 11c per lb. for dark, f. o. b. here. JOHN HANDEL, Savanna, Ill.

FOR SALE.—I have a quantity of choice clover honey in scant 1-lb. sections, and 12-lb. cases, at 15c per lb. (100 lbs. or more). Also 60-lb. screw-cap cans of extracted clover honey at \$4.90 per can; 2 cans in 1 box, \$9.60. Safe arrival guaranteed by freight. OLIVER FOSTER, Mt. Vernon, Linn Co., Iowa. 17tfdb

FOR SALE.—One ton section honey, in 20-lb. cases. It is A No. 1. Nearly 1600 lbs. is white-clover honey. GEO. RALL, Frenchville, Wis.

FOR SALE.—3000 lbs. of fine hearts-ease honey in first quality 1-lb. sections, 24 and 48 lb. cases, delivered free on board cars at Dixon, in good order, at 11½c per lb. Also 4000 lbs. of white-clover honey, at 13c. E. BAER, Dixon, Ill.

FOR SALE.—2000 lbs. of extracted honey in 60-lb. cans. I will send samples to any one wishing to buy. H. VAN VRANKEN, Union City, Branch Co., Mich.

FOR SALE.—4000 lbs. extracted clover and basswood honey, in 10-gal. kegs, 120 lbs. net, at 10c per lb., kegs thrown in. 500 lbs. comb honey at 14c. M. ISBELL, Norwich, Chenango Co., N. Y.

FOR SALE.—2500 lbs. of choice white clover and basswood honey, put up in 60-lb. screw-top cans, at 7c, cans thrown in. F. W. HOLMES, Cooperville, Mich.

FOR SALE.—Choice white-clover comb honey, 12 sections in case, 9 and 10 lbs. net, per lb. 13c, f. o. b. Second quality, 11c per lb. J. A. GREEN, Dayton, Ill.

FOR SALE.—25,000 lbs. choice extracted white-clover honey, in barrels holding about 550 lbs. net, each. I put it up also in packages of any size desired, in either wood or tin. There is no finer honey than this in the market. Write me what you want, and I will give you prices. EMIL J. BAXTER, Nauvoo, Hancock Co., Ill.

HONEY WANTED.—Write to CHAS. S. STRONG, Plymouth, Ohio.

WANTED.—Ten thousand cases buckwheat honey, in 25 to 50 lb. cases, and about ¾-lb. sections, well filled, in paper or pasteboard boxes. Will not sell less than 12 to 13c per lb. any year. We can never fill all our orders for such, as no bee-keeper uses the same style section and case, which curtails the demand for honey, as orders can seldom be duplicated. Such selling now at 13c per lb. All bee-keepers should use this size section.

H. R. WRIGHT, Wholesale Dealer, Albany, N. Y.
References: Albany County Bank, or any Mercantile Agency.

FOR EXCHANGE OR SALE.—Fifty colonies of Italians very low. What have you to trade? How many do you want to buy? Will include a first-class honey trade if all are taken. E. T. ABBOTT, St. Joe, Mo.

FOR SALE.—A little home of six acres of land for \$400. As good a location for bees as the county affords. Natural resources of honey splendid. For particulars address GEO. W. COOPER, Concord, Lewis Co., Ky.

FOR SALE CHEAP.—One second-hand 6½ horse-power Bookwalter engine and boiler, in running order. Price \$230, delivered on board cars at Rimerton Station, A. V. R. R. For full particulars address SAMUEL HEATH, Tidal P. O., Armstrong Co., Pa.

tries of the Universal Postal Union, 18
cts. per year extra. To all countries
not of the U. P. U., 42 cts. per year extra.

OUT-APIARIES, NO XVI.

TOOLS FOR OUT-APIARIES, AND WHERE TO KEEP
THEM.

WHATEVER tools you use in the home apiary, you are likely to need the same in each out-apiary. If a different person is in charge of each apiary, then each one must have his own set of tools; and even if the same force go in succession from one apiary to another, it may be the most convenient to have a separate outfit kept at each place. I do not think just now of any thing in the line of tools needed for an out-apiary, different from those needed at

ROBBER-CLOTH.

home unless it be a robber-cloth. I should not like to be without one of these in the home apiary, but they are specially valuable in out-apiaries where, sometimes, notwithstanding robbers are troublesome, your plans are such that you want to force through a certain amount of work. By having two or three robber-cloths I have sometimes been able

to go on with my work when, without them, I should have been obliged to desist. I'll tell you how to make one. Take about a square yard of stout sheeting or cotton cloth—if your hives are small, less will do. Lay one of the cut edges on a piece of lath, about the length of your hive; lay a similar piece of lath on top of it, and drivewire nails through both, at a distance of perhaps three inches apart. Let the nails be long enough to reach through and clinch them. Then treat the opposite edge the same way, and your robber-cloth is complete.

This robber-cloth is exceedingly convenient to throw quickly over any hive or super that you want to cover up temporarily. You can grasp the lath at one side with one hand, and, with a single fling, throw it over a hive and it is instantly bee-tight. It doesn't kill bees if any happen to get under it. If you have one hand occupied with something else, you can quickly uncover and cover with the other. I have sometimes worked with a colony when robbers were so 'bad' they would pounce into every opening; but a robber cloth covering the frames at each side allowed me to have an opening at the frame I wished to take out. As a general rule, of course I would try to manage not to work at bees at such times.

But to return. It would be very convenient, if you go about from one apiary to another, to have a little tool-house at each. I am not sure, however, that it would pay. A hive or box covered over with a water-tight cover (I use a tin hive-cover) answers very well. I would have one or more of these at each apiary at any case, for there are some things you always want to be sure of having on hand, as smoker fuel. Matches should also be kept under cover in such a place, in a tin box. A baking-powder box does well. Bee-hats, smokers—in fact, a full set of every thing, may be kept in the same way.

It is possible, however, to get on very well by always taking your tools with you, provided you never forget them. One day we went to the Hastings apiary without any smoker, and we realized then how important a smoker is. Don't trust to memory. In your record-book have a list of the things you generally need to take; and after you are all in the wagon, or ready to get in, read aloud the list and be sure that every thing is in the wagon, as: Hats, smokers, dinner (we never forgot our dinner), chisel, etc. My own practice has been a kind of compromise between having a full kit of tools at each apiary and taking every thing along. If a buggy is used it is not convenient to have very much bulk. By the way, a bad season is not without its compensations. I have had two years of such dead failure that we could make almost every trip the entire season in a buggy, for there was no honey to haul, and very little in the way of supplies. Marengo, Ill.

C. C. MILLER.

Now, look here, old friend. Here you have been recommending robber-cloths, while the fact is, that, during the three days I was with you, all over the premises in the honey-house and shop, and making myself at home almost everywhere, I never caught a glimpse of any such thing as a robber-cloth. I do not think I shall insinuate right here that some of the things you recommend are all on paper, for it just now occurs to me that the bees did not rob while I was there; in fact, even spilling honey on top of the hives did not make them rob, so I suppose you had the robber-cloths all rolled up and tucked in some neat drawer or cupboard. I thought of them once or twice; but there was so much talking to be done, that, before I got a chance, the matter escaped my memory. Now, I do not like a baking-powder box to keep matches in at all. It is too much trouble to pull off that tin cover every time you want a match. I know there is some danger of getting your fuel burned up; but I like to have matches so I can grab one up with one hand. It is something on a line with what I tell my wife about locking the doors nights. I would about as soon have burglars go through us, say once in about ten years, as to go through the operation of locking and unlocking so many thousand times, without any good from it. She thinks, however, that the feeling of safety and security amply compensates for traveling around night and morning to lock and unlock the doors.

TO PREVENT ROBBERING, ETC.

SEVERAL THINGS TO BE CONSIDERED IN GETTING READY FOR WINTER.

A CORRESPONDENT asks if musk will prevent robbing, if placed in a hive which is being robbed. Musk, spirits of turpentine, kerosene oil, etc., have all been recommended to stop robbing; but I do not believe that, after robbing is well under way, any of them will do any good. When robbers first attack a hive, a few drops of kerosene oil or spirits of turpentine sprinkled against the hive and on the alighting-board, a few inches from the entrance, will often cause robbers to leave in disgust. However, I find that the best way is to contract the entrance at all

times when robbing is likely to occur, so that but few bees can pass at a time. I have also tried leaving a pane of glass up before the entrance, as recommended by some of our English friends across the water, where robbers seem determined to enter any hive, but I do not see that it is in any way superior to contracting the entrance, while it seems to bother the bees of the hive much more. If robbers have really got possession of the hive, throw a sheet over it, so that those on the outside can not get in; and if the colony is good for any thing, they will soon drive out those already in, when the sheet is to be turned so as to get rid of them. Leave the sheet on till near sunset, when it is to be taken off so as to allow the few bees out to get into their hive. Fix the entrance so that but one or two bees can pass at a time, and the next morning they will take care of themselves. Something much better than the sheet for stopping robbers is a lee-tent, to be set over the whole hive; and where the apiarist has such a tent, it is hardly necessary for me to tell him to use it in place of the sheet.

FEEDING SUGAR.

Another correspondent wishes to know how to feed his bees on sugar. There are two ways of feeding sugar to bees; one of which is, to make the sugar into candy by kneading a little honey in with it, till it forms a stiff dough, as it were, or it can be made into large cakes of soft candy by boiling it just right in a little water, when it is laid over the frames for winter stores. During winter, the moisture arising from the bees collects on the candy, which moistens it to such an extent that the bees can lick it up, thus giving them a supply of food. However, during a cold spell it often happens that the bees fail to cluster on the candy, and the severe cold keeps them from leaving the cluster to reach it, so that starvation occurs, which is not satisfactory to the apiarist; hence this plan of feeding is not practiced, only as the bees have been neglected till cold weather prevents any other way of feeding. When a colony has a few pounds of honey in the hive to "bridge" over these cold spells, this way of feeding is very satisfactory for the purpose intended. The second plan, and by far the preferable one, is to make the sugar into a syrup, which is fed to the bees in feeders during the warm days of September or October, so that they can store it in their combs, and cap it over the same as honey. As I have so many letters asking how I make this syrup, I think the editor will publish the matter again, even if he has already published the formula twice before.

Put 15 pounds of water in a vessel that will hold about 25 quarts, and bring the water to a boil. When boiling, slowly stir in 30 pounds of granulated sugar, so that it will dissolve, instead of settling to the bottom and burning. Now bring to a boil again, when it is to be set from the fire, and 5 pounds of good honey stirred in. This gives about 50 pounds of feed, of about the consistency of honey, the same being the best for winter feeding of any I know of.

BEEES DROWNING IN FEED.

Still another correspondent wishes to know how he can feed his bees syrup without their sticking fast and drowning in it. To obviate this a very narrow feeder must be used so that the bees can cling to the feeder on each side, or a float must be provided for the wide feeder. A feeder which is more than $\frac{1}{2}$ of an inch wide will always drown

bees unless the float is used. One of that width and under, needs no float, for the bees are never out of the reach of one side or the other of the feeder. As the larger part of those feeding bees use any thing that they come across for this purpose, the common six quart milk-pan is probably more largely used than any thing else. I will tell the readers how I use this successfully. To use such a pan as a feeder, however, the hive must have a cover of depth enough to go over the pan, otherwise the bees from the outside would get at the feed and cause trouble. Set the pan on top of the hive, and fill it with syrup, after which pull up two or three handfuls of the short grass about the hives, and scatter over the syrup for a float. Set up a piece of a section or chip against the side of the pan, so the bees can easily climb over to the feed, when a hole is to be opened to the hive below, by turning up one corner of the quilt, or removing a slat in the honey-board, for the bees to come up through. I now scatter a few drops of the feed down through the hole and over the chip, and put on the cover, seeing that all is tight about the joints, so that no bees can get in from the outside. As these pans hold about 20 pounds of feed, this once feeding is all that most colonies require.

UNITING BEES.

Another correspondent wishes to know how it would do to unite two weak colonies of bees for winter. This is the proper thing to do; for two weak colonies, kept separate, will consume nearly twice the stores which both would unite, and very likely perish before spring, while if put together they would winter as well as any large colony. The way I would proceed in such a case would be as follows: If one of the queens is known to be feeble or inferior, she is killed, so that the best one may survive, when both colonies are smoked freely, I pounding on top of the hive as I smoke them, so that the bees may fill themselves with honey, after which one is carried to the stand of the other, and both hives opened. I now select out of both hives the combs containing the most honey, setting them in one of the hives alternately, so as to mix the bees as much as possible, thus causing them not to fight, and also to mark their location anew upon their first flight afterward, so few if any return to their former home. After the hive is filled with comb, close the same; and after putting a wide board in front of the hive, reaching from the ground to the entrance, shake the bees off the remaining frames, taking one from one hive and the next from the other, thus mixing the bees as before. Take every thing, which would look like home, from the old stand, storing combs, hives, etc., away for another year, and the work is done.

G. M. DOOLITTLE.

Borodino, N. Y., Sept. 23, 1889.

In addition to the matter of robbing, I would say, be sure that the robbed hive has a laying queen, or unsealed brood from which to raise a queen. If they are queenless, and destitute of all means of raising a queen, you may try all the recipes and plans ever invented, and they will not avail a particle; and where robbers have really got a going, as friend D. says, nothing avails but to shut the hive up with a cloth or bee-tent, or some equivalent; and even then, where the queen is gone, I know they will go right at it again just as soon as the tent or cloth is removed. In regard to adding honey to

the syrup, unless you know where the honey came from, be sure it is scalded enough to kill all germs of foul brood. A burnt child dreads the fire; and I tell you, we have been burned terribly. To prevent bees drowning, when feeding in a tin pan, a great many use simply a piece of cloth spread over the pan. The wooden butter-dishes, we have found perhaps the cheapest and simplest of any thing in the line of feeders. Even without a float, they seldom drown in these. So many bees pile into them they are empty before a bee has a chance to die. Our experience in uniting is much as given above, except that sometimes a good many bees will get back to the old stand, or go to hives adjoining the old stand.

INTRODUCING.

DOING IT WITHOUT LOSS, ON THE CANDY PLAN.

MUCH has lately been said on the subject of introducing queens; and I would say, after having tried all the various methods in use, that I have, for the last two years, introduced without the loss of a single queen, with a wire tube similar to Doolittle's cage for introducing virgin queens, only there is no wood, except a plug, for each end. I fill the cage half full of candy, and fill the end with a wooden plug, in which there is a hole just large enough for a single bee to pass through. I put the queen in the other end and plug it up, or pinch it shut. I place this cage between two top-bars over the center of the brood-nest, and close the hive; and by the time the bees eat through the candy, which is usually inside of two days, they are so well acquainted with the new queen that she is safe. By this method I lose no queens, and I also get rid of the bother of releasing the queen, removing the cage, etc.; for, lying as it does between the top-bars, it is no hindrance to the bees or anybody else. I think that any colony of bees will more readily accept a queen if they are not disturbed after the cage has been placed in the brood-nest. CARNIOLANS DISCARDED AFTER A CAREFUL TEST.

In a former article I think that I spoke of our Carniolan queens as being among our best layers. Now, that is about all I can say for them; and at the close of the season, having given them a thorough test, I can say that they are no better workers, and no more gentle, than our Italians; and looking, as they do, so much like our common black bee, I have discarded them, and next season we will raise nothing but Italians.

SUPERSEDITION OF YOUNG QUEENS.

We commenced this season with 45 colonies, and increased by natural swarming to 78, and doubled back to 64 for wintering. About two-thirds of these new swarms issued with virgin queens; and a number of colonies that did not swarm at all, superseded their queens during June and July. This is something new in my experience, to see such a wholesale superseding of young queens, for most of them were of last season's raising.

This has been the poorest season I ever saw. There was plenty of clover and other bloom, but it has been too wet and cold for the bees to do any

thing with it. But very little buckwheat was sown in this locality, and, as a result, our fall crop will be light. There is an abundance of goldenrod and asters, but they do not as yet seem to entice the bees. For the last two weeks there has been considerable honey-dew on the oak and hickory; and I judge from the dark color of the honey now being stored, that it comes principally from that source.

I don't think that our crop of honey will exceed half a ton, all dark, stored in one and two pound sections; and if we had not done a fair business in selling untested queens our books for the season would balance the wrong way. S. W. TAYLOR.

Harveyville, Pa., Sept. 9, 1889.

No doubt, friend T., you have never had a failure by the above plan; but it does fail, however, now and then, like every other plan of introducing. Suppose, for instance, you tried to introduce to a colony with two queens in a hive. After taking out one you supposed them to be queenless, while the truth was they had a queen already. In such cases the new comer will be destroyed, no matter how she is introduced; and a great many troubles and disputes have come about in just this way. It is not at all uncommon to find two queens in a hive, and it therefore follows that it is not uncommon for a queen to be in the hive, even after you are sure you have removed one queen.

HUMBUGS AND SWINDLES PERTAINING TO BEE CULTURE.

THE GOLDEN BEE-HIVE, AGAIN.

There is one J. B. Pickrel, purporting to be of Nashville, Tenn., doing up the western portion of this State with the oft-heard-of Golden bee-hive. I was on a visit to friends last week, and I found that he is simply coining the cash out of those poor ignorant mountain people. He sells a farm-right to make and use his hive, for ten dollars. He also gives a small book, which seems to be only extracts from some work on bees; yes, a circular too, one of which I will inclose. This circular is what sets them on fire; and I learn, and that, too, from one of his victims, that there is no difficulty, once the circulars are in the hands of any that are the least inclined to bees. There are quite a number of statements in this circular that will call forth criticisms.

A. L. BEACH.

Pineville, N. C., Aug. 16, 1889.

Thank you, friend B.; and we shall be very much obliged to any of the friends if they will send us similar circulars, and report to us any such doings. We have referred to this circular before, but it will not do any harm to keep it before the people. There are a number of testimonials from those using the Golden bee-hive. We give just one, as a sample:

Prof. A. J. Cook, of the Michigan Agricultural College, at Lansing, reports over \$80 from each swarm of bees kept in the Golden hive last year.

The man who obtains money by exhibiting such a circular, can certainly be arrested for obtaining money under false pretenses. Prof. Cook has never had any experience with the Golden hive at all, and, of course, never made any such report. Will some of

our legal friends tell us what can be done with a man who sends out circulars containing statements like the above, which are but little better than forgeries?

FALSE STATEMENTS IN REGARD TO THE HONEY BUSINESS OF OUR COUNTRY.

As a protection to our bee-keeping population, we propose in this department to publish the names of newspapers that persist in publishing false statements in regard to the purity of honey which we as bee-keepers put on the market.

They have a man in Pittsburgh who comes out in print and declares that comb honey is manufactured, and that he has samples of it, and can prove it by the microscope. Here is what he says in the *Pittsburgh Dispatch* of Sept. 23; but before reading it, we would refer our readers to page 757 of our previous issue.

ANOTHER WORD ABOUT MANUFACTURED HONEY.

A letter appeared in a recent issue of *The Dispatch* in reference to some statements made in the article by the writer, on the subject of sugar and honey. It has been my intention not to answer this letter, but at the request of many friends the writer wishes to make the following affirmations:

First, that he has found a comb honey (?) on the market which contains no evidences of the presence of any bee product whatever. There is no heresay evidence about it — the specimen was handled and microscopically examined by the writer. Second, that each and every one of the adulterations stated in these articles to have been found, were detected by the writer himself in samples obtained as stated. In all cases where possible, samples of the adulterated foods have been retained, with proof of the adulteration found.

The one thing above all others that is claimed for these articles is accuracy; and when any thing has been asserted on hearsay evidence, it has been so stated. The writer does not care what the supplement of the encyclopedia mentioned said or did not say. He knows what he has seen, and he can prove it. But he declines to enter into a controversy, as he does not wish to go into the detective business or compete for prizes. However, if the doctor who wrote the letter referred to, or the gentleman who is offering prizes, or any one else will come to the writer's office, he may see a sample of adulterated comb honey with irresistible proof that it is such. CHEVALIER Q. JACKSON, M. D.

Pittsburgh, September, 21.

Mr. Jackson, we beg to inform you that, among the bee-keepers of our land, are some of the most expert microscopists to be found in the world. We are fortunate in having, in the person of Mr. M. H. Tweed, of 154 Webster St., Allegheny City, a man who is expert in every thing that pertains to bees, honey, and the honey market. Will he kindly visit friend Jackson, and carry the thousand dollars to him, if he declines to take the trouble to come after it? If, however, his specimen of honey proves to have been made by the bees, we deputize friend Tweed to present Dr. Jackson's apology to the bee-keepers of our land. Our laws clearly protect us from damage sustained, resulting from false and slanderous statements. Now, it is not an individual who suffers in a case like the above, but it is a nation of people. It is estimated there are over 300,000 bee-keepers in this land of ours. This doctor, who has a microscope, has struck us all a blow; and if, when the truth is presented to him, he refuses to retract, and he has ample proof of his blunder, we, bee-keepers of the United States, propose to see what we can do with him.

TYPES OF BEES.

BEES FROM DIFFERENT QUEEN-BREEDERS.

PERHAPS one who never studied the habits of bees would conclude that all types of bees, according to numerical strength, are alike industrious. But the practical apiarist knows that there is as much difference in the disposition of bees as there is in men. In the morning, when I go round the apiary I at once notice the vim and eagerness of No. 3 of J. C. Frisbee's strain. With the first gray streaks of dawn they are off with a rush as if bound for the first nectar of the morning bloom. I have often thought, "You certainly will wear yourselves out; you are too eager to be jeh."

In looking around I see a few bees beginning to fly from No. 4 of A. I. Root's strain, which is a trifle brighter than Frisbee's. Gradually No. 4 comes up until 10 o'clock, when the heaviest field force is coming from this hive, which is a constant rush through the warm part of the day.

I have some of J. M. Jenkins' strain of Italians which are beauties, but they seem to be lazy, not good comb-builders. They are a trifle longer, and the queen is yellower than Root's or Frisbee's. The Root bees seem to incline toward red clover, while Jenkins' work mostly on touch-me-not. Frisbee's will suck red horsemanit or any thing. I have black bees, which, during poplar and basswood bloom, are about at the top. For hardiness and comb-building qualities, blacks lead the world. They will kill their drones earlier than the Italians. They build up faster in spring. They cap their honey whiter. They are easier run out of sections. I have seen round gums of blacks so heavy that a strong man could not lift them. A neighbor once killed two black colonies and obtained from one 11 gallons of honey and from the other 12.

G. W. MCGUIRE.

Dark Ridge, N. C., Aug. 19, 1889.

Is not the peculiarity you mention, rather the result of accident than because the bees were particularly different? Our stock all comes from Italy, therefore we presume it will average about the same, year after year. If I am correct, friend Jenkins also depends upon imported mothers for his best bees.

BEE-KEEPING IN SOUTH AFRICA.

AN INTERESTING LETTER ON HOW THE NATIVES SECURE THEIR HONEY; WHAT THEY DO WITH IT, ETC.

MR. ROOT:—Some time ago I wrote you that Mr. Wilcox's GLEANINGS came to me, and ventured to suggest that, if it continued to come, it would be very acceptable to me, and in return I would try to inform you of "sweet" matters in this vicinity. I see Bro. Goodenough is portraying his system of bee-keeping, as carried on in Natal, and a comparison of other methods as carried on here by the natives may be interesting. We are some 600 miles from Natal, and that is our nearest point of supplies. We could not get a pound of flour at any nearer point, nor a tack, nor pin. But honey is abundant here—more so than there is any demand for.

AN AUTOMATIC BEE-HIVE; A SELF SWARMER, HIVER, ETC.

The method of bee-farming as it is carried on here

is as follows: "A native cuts a circle in the bark of a tree, and about three feet above he cuts another; then he cuts in a straight line from one circle to the other, and strips off the entire bark as cut. While this is still green he refolds it in the shape of the tree, and carefully sews up the center seam; and after folding the two ends in a more or less square form he sews them up, leaving the merest entrance for necessary purposes. His thread is bark, and his needle a thorn, and his punch is his spear. This article, I will tell you plainly (you would never guess), is a bee-hive, and it does excellently well for this class of bees, and this system of bee-farmers, and this climate. This bee-hive is now placed in the top of any large tree, and others with it, and then left to future developments. It is automatic throughout, if it acts at all; self-hiving, self-swarming, self-regulating; and about half the time it appears to be an automatic fizzle as a honey-collector. I am no expert on matters pertaining to the apiary; but such observations as I have noted are from an amateur's point of view, and are to be valued as such. However, I may underrate the excellences of this system of hives.

The forests all about are well provided with these hives, and bees should not fail of finding comfortable habitations in their native forests; but they do take unaccountable notions at times, and I have had pitched battles for a week at a time to keep them out of our spare bed-room; and whenever a sack of sugar is opened, or any thing they take a notion to desire, they monopolize the house till we discover what is the matter with them, and then the desirable thing is put in a strong case, bee-proof, and then after smoking, brooming, and general destruction so far as we can apply it, the bees depart till we are unlucky enough to get something else about that they conclude is desirable for them.

On one occasion, a swarm having alighted on a tree close to the veranda, and appearing to be preparing for a charge on the house, I drove them away by firing two loads of dust shot into them at short range; but whether they were confounded by the noise, or were actually alarmed at the terrific losses sustained, or whether they had no intentions on the house or not, all is a conundrum to us; but they gathered up and went their way in about 15 minutes after the shots.

The bee in this vicinity is not so large as the honey-bee in America, nor is it very much smaller, certainly not so small as Bro. Fuller's are in India. The swarms that have alighted about the house from time to time are about the size of a half-bushel, and to all appearances I should call them active and determined workers, persistent fighters, and excellent thieves. You will no doubt at this point, if not before, ask within yourself, "Why doesn't he hive those bees and have honey?" The answer is not far to seek. We do have honey-bees thrust upon us, and strained honey is always in the house at about 10 cts. a bucketful (three gallons). Comb honey we never see; but with honey so cheap, and no market for any quantity, great or small, we do not care to have the bees about. We should like nice comb honey, but even this can be had if one is at hand when a box directly from the tree is opened.

I will now proceed with the native method of securing the honey. The hive, as stated, is placed in the tree, and in time, sooner or later, bees do come to the most of the hives, and in time they fill them

with honey. The native usually visits his hives frequently; but sometimes they are left for a long time, when the honey is of a richer quality, and much thicker than any I ever saw in America. It is possible, with the sides of the knife greased, to cut through strained honey, leaving the furrow open and clean for a minute or so after the cut is made. Probably the climate is the chief agency in ripening the honey to so fine a state. When the hive is judged to be full, or when he sees the thing swarming, the native will take down his hive, and extract the honey. This matter of "extraction" is a simple one with him. He takes his hands only, dips in, and takes as much comb honey as he can manage, and squeezes it over and over until he gets most of the honey out. Then when the hive is thus manipulated he takes his wax and melts it in his mush-pot, and, digging a round hole in the ground, about two inches in diameter, and six inches long, he runs his wax in the shape of the molds, and in this shape it comes to market. Some of it is a rich clean yellow, and commands the best price; but more than half of it is dirty, mixed with sand, and is only two-thirds value. First-class wax brings to the native, cash in hand, 360 reis per kilo, or about 18 cts. per lb. The trader takes this wax, and melts all the poorer quality in a large caldron with a faucet some six inches from the bottom. He also adds water, and the wax, when melted, rises, and the sand and other dirt settles into the water. The wax is then drawn off through the faucet, run into cakes about 18 inches by 24, sewn up in a bark skin, and in this shape is shipped to Europe. More than 20 tons are shipped from this port annually.

THE NATIVE HONEY WINE.

But the honey: This product would be much to the credit of the country if not manufactured into something else. The honey will bring the native nothing. He would sell it if he could; he will sell any thing that will bring him copper coins; so he has invented one of the worst uses to which it can be put, and in this manner honey is always in demand. He adds about three parts of water to one of honey, lets it ferment for three days (I can't say just how long positively), and then it becomes one of the severest intoxicants the country produces. It is more maddening than sugar-cane rum, and has the name of being the severest of any of the common native drinks.

Most providentially for the wholesomeness of the country, the supply is limited; and the population being great, the evils are somewhat ameliorated. The native is ingenious in some things at least. With mud pots, with old gun-barrels for pipes, he will distil rum from sugar-cane, cashew fruit, coconuts, pine-apples, farina, corn, sweet potatoes, honey, and one or two vegetable-roots which are found in the forest. All of these substances are abundant in their season, and rum retails at about two cents a tumblerful.

The product in wax, if as much along the other coast ports as here (and I think it more than likely), amounts to more than 100 tons per annum; but with prices paid here, and with \$20 per ton freight to Europe, it would not seem possible to interfere with American prices as quoted from time to time in GLEANINGS. The possibilities for honey in this region are most favorable, without a doubt, and sufficient honey might be produced all along this coast to glut all the markets of the world, and that at the minimum rates of production; but

it is very doubtful if the world will ever see this honey, unless immigration sets in, or the native becomes civilized, and, what is more to the purpose, Christianized. With the former we are in no way connected; but in the latter we are hard at work, and welcome the wholesome Christian spirit manifested in GLEANINGS.

E. H. RICHARDS.

Mongwe, Inhambane, E. Africa, June 7, 1889.

Friend R., we are exceedingly obliged to you for your vivid description of bee culture in your far-away home. Those cheap hives fastened up in the tree-tops are a revival of the matter of decoy hives that has been at different times so fully discussed in GLEANINGS, and I think those very decoy hives placed in the forest in most localities near our large apiaries would get more or less bees and honey. Do you mean to tell us that that thick honey which can be cut with a knife is sold for 10 cents a pailful? Why, I am sure it can be put in suitable tin cans, and shipped so as to give your native friends a better price, and at the same time give the great outside world honey at a lower price. May be you would need a railroad to do it; but the railroad is surely on the way to you, and it is coming right along the line of your closing sentences. This matter of intemperance will probably have to be fought inch by inch, and it seems sad to think that it must follow in the wake of missionary work. May the Lord help us to break loose from this terrible bondage. Are you sure, dear brother, that it is beyond the possibilities for some of our enterprising bee-men to open up bee culture and make use of this honey that you say could glut all the markets of the world? Either you have immense resources in the way of honey, or else the world is larger than either you or I know, in my opinion. On visiting the salt-works of Michigan during my recent trip, I thought more salt was being produced than all the world could use. And yet I found afterward that I had seen only a very inconsiderable establishment compared with others in the vicinity of Manistee.

GETTING OUT OF OLD RUTS.

SHALLOW OR CLOSED-END FRAMES.

THREE years ago I became convinced that a better road lay close alongside the old Langstroth trail, made by the Eight-Frame Co., with which I had been jogging for ten or a dozen years, and I decided to pull over and give it a fair trial. Though convinced in mind, it has taken three years of training to get the other members of my personal organization out of the old rut sufficiently to give the new a word of praise; but I can say now, with head and hand agreeing, that a shallow closed-end frame, and sectional brood-chamber, outranks every thing else at these headquarters.

PERFORATED ZINC.

I asked you, at the Indianapolis convention, if you would advise us to use perforated zinc. You said it would pay, in your opinion. I can't see why I did not invent it years ago. It is indispensable. I should like two sizes—one so small that a virgin queen could not go through provided the nurse-bees could. I use a nursery frame like comrade

Manum's, but mine is the thickness of a brood-comb, and twelve of them stand in a Heddon frame. The top is closed by a queen-cell protector, made of tin, with a cover. I can remove the cell without lifting the cage. My first experiment was to make the cage of perforated zinc, believing the queens would be better if the bees could get into the cage; but I was obliged to cover them with wire cloth, as every queen escaped. I think we sometimes lose a valuable queen by using the excluder. I found one with her head and shoulders through. The bees above were trying to pull her up, and those below were pulling her down. The legs and wings were pulled off, and yet she was fast, and one will sometimes get through; but all losses are more than repaid by having a fair colony to feed through July and August, instead of a hive running over with bees that has been a waste of material to manufacture and support.

FLAT-BOTTOM FOUNDATION FASTENED AT BOTH TOP AND BOTTOM OF THE SECTION.

I got some of the extra-thin flat-bottom foundation of you two years ago. I tried it with poor success. It was so thin it would curl and get all out of shape; but when I discovered that I could fasten it in, almost like a drumhead, with a machine I made from the cut in your price list of the Gray fastener, we could use it a little lighter than the extra thin. I cut the sheets to inside dimension of the section, and fasten one end, turn and give the foundation a little tuck under and against the presser, which stretches it out and fastens it at the same time. It can be done pretty rapidly after a little practice, and it is a comfort to have the foundation so solid that any kind of rough treatment, even a tumble off the bench, will not break it out.

ONE-PIECE SECTIONS.

I do not like the one-piece section. It is too much trouble for me to twist up one corner of my eyes, and then the other, to get a square look at them. I do not like men, nor the products of their labor, that require a continuous outside pressure to keep them square. They are a little cheaper, which adds to the profit, and a little stronger, which is an advantage in jumping sections. I like the square section and a dash of Carniolan blood, as they are not such sticklers as Italians.

CHAPMAN HONEY-PLANT.

This is the best honey-plant I ever saw for its season. Friend C. said at the Indianapolis convention that the seeds were not provided with balloons to scatter it, but he failed to state that it had a chaff that would adhere to almost all passing objects, and that it had a way of arranging itself in the fluffiest possible manner on top of the ball, as if darning the winds for a trial of strength. I believe it will give our farmer neighbors just cause of complaint against us, if we allow the seeds to ripen. My crop is harvested, and arranged in a pile with balls inward, and some evening when it is dry we will have a war-dance around it.

HOVEN.

I have never heard of a death from clover-bloat where the wooden bit was fastened in the mouth. The process is described and illustrated in *Farm and Household Encyclopedia*. A. A. PARSONS.

Avon, Ind., Aug. 31, 1889.

Neither do I like men that require a good deal of outside pressure to keep them square. But you admit that the one-piece sections are a little cheaper and a little

stronger. I think these two points alone should settle the question.

REPORT FROM AUSTRALIA.

WHAT THE SPIRIT OF CHRIST IS DOING AMONG SAVAGES.

WE have just passed through a season of severe drought, which has caused us to lose heavily both in cattle and in the honey crop, which was a total failure. We have, however, every prospect of a good crop to come, as the drought has been broken by heavy rains, which, we trust, will give us an early and bountiful spring. We have had floods, but they were nothing in comparison to what it has pleased God to send you.

I read with much pleasure L. E. Mercer's little note in February GLEANINGS, entitled "Honest Bees and Honest Neighbors." It reminded me of something I heard the other day, which I thought at the time would please you. I had the pleasure of spending a few days with a missionary from the New Hebrides, who told me that, some years ago, he went home to Canada on a year's leave. While there it was considered advisable that he should remain and preach mission sermons throughout the Dominion. When he returned to Eromanga he had been away just two years and eight months. They had left their house open—not a key turned in cupboard or door, and they found every thing exactly as they left it. The trees they had planted had been carefully tended; the house and grounds were as clean and white as lime and pounded coral could make them; and during all that time no white man had set foot on that island. When we consider that, only a few years ago, these people were savages and cannibals, it speaks wonders for the work that has been done among them.

SOPHIE A. BRADLEY.

Campbelltown, New South Wales, June 10, 1889.

Many thanks, my good friend, for the delicate compliment you pay me. To be sure, it always pleases me to hear testimony that speaks of the power of Christ's love. My opinion is, that that missionary was respected and beloved by his people. It was out of love to him that they kept his house and garden in such neat trim for almost three years; and the little incident portrays what the love of Christ may do for the human heart; yes, even for the heart of a savage. Just think of the wonderful stride made in a few years, from cannibalism to Christianity!

A GOOD REPORT.

AN ENTHUSIASTIC BEGINNER'S EXPERIENCE.

I HAVE to report from Fillmore Co. a very good yield of honey for 1889. Although I am a very small bee-keeper compared with some of my neighbors, if we may judge others by ourselves, I feel safe in saying that the amount gathered is wonderful. I started with four good colonies, and a hive literally raised from the dead. I have always run my bees for extracted honey, and started out so this year, taking 33 gallons of white clover and basswood honey, and increasing

my stock to 10 colonies; then I put sections on five hives where the bees showed disposition to work in them. I shall get 25 pounds of this honey to the hive, and the hives are "chuck full" below (the whole 10).

BUCKWHEAT.

There has been a good buckwheat harvest, but this I have not extracted, as I should like to have the bees well fixed for winter; but some of my neighbors kept the extractor going all through August, and, of course, have more honey than I have.

BEE-STINGS OR HONEY FOR RHEUMATISM—WHICH?

I have thought over that bee-sting remedy for rheumatism, and have come to the conclusion that Prof. Cook is about the man to settle the question. I have had the disease, and have taken much of the medicine, and am very much better than I used to be; but I rather prefer to call honey the antidote, as I eat a good deal, and like it; but I can't say that I relish the sting.

GLEANINGS.

I take a deep interest in GLEANINGS. Every subject treated on captivates me completely, and I never tumble the leaves over for something better. I just begin with the very first page, and quit when I have to. The letters from foreign lands give me especial delight. I read the little letter from Scotland over several times.

C. C. MILLER'S METHOD OF NUMBERING HIVES.

C. C. Miller's hints are worth many times the cost of the journal to new hands at bee-keeping. Numbering hives is a great help, and I shall have a number on all my hives after this, for now I have to name them, and No. 4 is much easier to speak or understand than to say the "red-topped hive," or "the hive over next to the cottonwood."

A QUEEN-CELL ON DRONE COMB.

My neighbor showed me a queen-cell on drone comb, and says they frequently make them so. This is new to me, and I am slow to believe that bees are so stupid. What says GLEANINGS?

Preston, Minn., Sept. 2, 1889. F. A. CUMMINGS.

Bees do quite frequently start queen-cells on drone comb. In this case, however, they are smooth on the outside, instead of having the usual indentations. The drone larvæ, however, instead of becoming a king is evidently sickened or put out by the royal jelly, for he soon dies. Yes, the bees are sometimes just so stupid.

THE MATING OF A QUEEN AND DRONE BUMBLE-BEE.

WHAT AN EYE-WITNESS SAW.

I SAW a queen bumble-bee mate to-day; and thinking it would be of some interest to others I will tell what I saw of it. It was at 11:30 A. M., while I was cradling buckwheat. I heard the buzzing of bees, and on looking down in front of me I saw a queen, and a drone bumble-bee on her back, and another drone flying about them, trying to get hold of the queen. The queen was then walking on the ground. I drove the drone away that was flying. Then the queen became quiet; then they mated. I waited nearly four minutes, then killed them both. I will send them to you by mail as proof of what I have described.

I think that honey-bees must mate in a way very

much as the bumble-bees do. About two weeks ago I was working some 40 yards away from my yard, where I have 25 nuclei. My attention was called by hearing an unusual buzzing over my head. I saw a small cluster of about 15 or 20 bees flying about 15 feet high. They seemed to rush together and fall nearly to the ground, then start in another direction, and again rush together, but each time they seemed to lose nearly half of their number. I saw them rush together three times before they were out of my sight. From what I saw to-day I am quite sure that it was a queen taking her flight.

C. M. WOOLVER.

Richfield Spa., N. Y., Sept. 9, 1889.

We sent the above, together with the two bumble-bees, to Prof. Cook, who replies as follows:

Friend Root:—I thank you for the specimens. As you will see in my Bee-Keeper's Guide, p. 92, I have seen the same thing. Mr. Woolver leads us to think that the mating was done after the bees fell to the ground. Is he sure of this? In cases seen by me, copulation seemed to be accomplished while yet on the wing; yet in all cases the bees, while in copulo, fall to the ground. I had supposed that the expiring male drew the queen to the earth, and that the queen then pulled away, bearing with her a part of the reproductive apparatus of the male. It would be interesting to know if the drone and queen of our honey-bees, while in copulo, fall to the earth. If so, it would be strange that no one ever yet saw them. Has anyone ever witnessed such an event? In one case that I saw some years ago, a queen bumble-bee was dragging a nearly dead drone along the earth while yet in copulo. I believe this the method of gaining freedom, among bumble-bees.

A. J. COOK.

Agricultural College, Mich.

ALBINO BEES.

PROF. COOK GIVES HIS OPINION IN REGARD TO THEM.

IT is well known that a true albino is really a diseased or imperfect organism. For some cause, the tissues which usually secrete pigment, or coloring matter, are unable to do so.

The hair is white, the exposed skin is pink, as its transparency hides not the blood in the superficial blood-vessels, and for like cause the eyes are pink. Thus the skin in a human albino is tender, and the eyes are so unprotected that they can not bear the light of day. A hare lip is no more a malformation than is albinism. The fact that man, by selection, has perpetuated this peculiarity in some animals makes it none the less a diseased condition. All animals tend to reproduce unfavorable as well as useful peculiarities. I have read that albinos often intermarry, and thus there is unfortunately a tendency to increase and perpetuate this diseased condition among people. Now, I do not think this any argument against the so-called albino bees. Scientifically such bees are not albinos. They are not white. They only show more white than others of their race. Thus, if I am correct, these bees are no worse for their characteristics. They are not physiologically deficient as are true albinos, but only sports, or more properly varieties. Now, if, as varieties, they have valuable characteristics, as their friends claim, then they are superior. Their

lighter color enables us to distinguish them, and, if persistent, marks them as a distinct variety. They are no better or worse for it. While the name albino is not really correct as applied to these bees, yet there is no harm in its use. As yet, I have never seen one true albino bee. Yet I have seen albino crickets and cockroaches. There is no reason why we may not have one of these physiologically imperfect bees. Even should this occur it would cause no trouble. We all know that albino bees, as sold in the market, are simply a light variety of the Italian race, and no trouble need occur. True albinos will be very rare at best, and never can cause any serious misunderstanding. A. J. COOK.

Agricultural College, Mich.

I believe I entirely agree with you, only I do not like the term "albino," as applied to bees. A good many people get the idea that they are to have a bee that is perfectly white, or very nearly so; and when they receive bees so near like the ordinary Italians, they are very apt to be disappointed, and sometimes claim that they have been swindled. We did once have a strain of so-called albinos that showed rings of a creamy white, as well as of yellow and black. It gave the bees a singular look, something like white-ringed hornets, but they were like Italians in every other respect, so far as we could discover. These came the nearest to being albinos of any thing we have ever seen.

EXTRACTORS AND THEIR CONSTRUCTION.

E. FRANCE GIVES US SOME VALUABLE SUGGESTIONS.

I AM asked to give a description of my honey-extractor. The one I use is a very common one. It is the Chapman with some little alterations to make it fit my large frames, and to do faster work.

MY FIRST MACHINE, AND SOME OF ITS DEFECTS.

I don't know just how long it is since I got my first machine. I have no records further back than 1877; but at that time I had one extractor—the old revolving can—made by Winder, with an outlet under the bottom. The outlet was so small that I could plug the hole with the end of my finger. After I had extracted two combs and stopped the machine the honey would run out, if the outlet was not choked. But it very often clogged with a bit of capping or some pieces of comb. I kept a pail under the machine to catch the honey. When I emptied the pail I had to whirl the machine to keep the honey from running out, and then empty the pail when the machine was in motion. That extractor, unhandy as it was, cost me \$20.00. At that time I had two or three out-apiaries, and used to take the extractor and honey-kegs and all fixtures, including help, all in one wagon, and stay over night, and come home when we had finished.

THE NECESSITY OF HAVING MORE THAN ONE UNCAPPING-KNIFE OR EXTRACTOR.

For the first three or four years I had only one uncapping-knife. But as our business increased I got another. Now, it just happened that, a short time after I got our second knife, we broke one of the knives. That just set me to thinking, "Suppose we should break our extractor right in the midst of our extracting season; it would take ten

days or more to get another. All work would have to stop, and the loss of time would be several times the cost of another extractor." So I resolved to get another machine.

THE CHAPMAN EXTRACTOR.

One of my neighbors had a Chapman extractor, and I could possibly work my frames in it, but it was too small to be handy. But I sent an order to Mr. Chapman to make me a machine, and sent him two of my frames so as to be sure to get it big enough. I wanted the comb-basket made out of heavy wire cloth at least as coarse as three meshes to the inch. We got the machine. The wire-cloth basket was a good deal finer than I ordered, and the basket was too small every way for quick work. A clean frame, with no bits of brace-combs on top or sides, would go in nicely; but as the combs came from the hives they made trouble.

THE HOME-MADE MACHINE.

After using that a year or two I concluded to make one to suit me; so in the fore part of winter I sent and got two sets of upright gearing and some wire cloth—enough for two machines. During the winter I made the two machines. The old Chapman had a 1½-inch honey-gate. I put 2-inch ones in the new machines, and also a 2-inch gate in the old Chapman.

I made the comb-basket larger and deeper; raised the basket higher from the bottom, so that it would hold more honey. Of course, the outside can is made larger. It will hold now, as I made the last ones, 70 lbs. of honey below the basket.

I don't think that the machines that I use are perfect; but for my use, with my large frames, they are the best I have seen. There is a good substantial frame around them that protects them, and they stand on four legs and don't jump and run all over creation when in use, but stay where we put them.

Now, let me say here that the Chapman extractor, as he makes it, is large enough for most frames in use, and is a good machine. The only trouble in my case was, that my frame was too big for it, and so I had to make the machine to fit the frame. I made the comb-basket of heavy tinned wire cloth, two meshes to the inch. That is fine enough.

UPRIGHT GEARING.

I use the upright gearing because I think it is best, and I believe it is easier to work. Perhaps it is just a matter of opinion with me. My first machine had the upright gearing, and I have never had any other. But I helped a man extract about two hours with a Novice machine that had the horizontal gearing. I did not like the movement. I decidedly prefer the upright. Perhaps my preference is all in the use of the upright.

WHY I PREFER TO HAVE THE EXTRACTOR-CAN ENCASED IN A WOODEN FRAME.

First, the frame is a great protection to the can; it keeps it from being jammed; second, the machine is always ready for work, as it stands up from the ground or floor high enough to set a pail under to catch the honey. I see no use of a box or stand to set the machine on, in order to have it high enough to drain off the honey. The frame gives us four legs for the machine to stand on; and as we do the most of our extracting on a ground floor, we can easily adjust the machine so it will stand level and firm. The frame gives us a large base, which goes a great way toward keeping the machine steady, and prevents its jumping while in

use. Of course, the machine takes up a little more room; but room out here is cheap. We keep one extractor at each yard, besides an extra one at home. We prefer to have the

EXTRACTOR-BASKET WITH SLOPING SIDES.

so that, when we set in a frame against the wire cloth, it will stay there and not drop over against the center-shaft before we get up the motion. The reason I make the comb-basket frame of wood, in place of metal, is, that the one I patterned from was wood, and for me I could make them cheaper of wood, and I think them just as good as the metal.

HONEY FLYING OVER THE TOP OF THE CAN.

As for the honey flying over the top of the machine, with our old revolving can the honey did fly over the top; but the machine we now use never throws honey over the top of the can. Our extractors now have a cover over a little more than half of the top, when in use, and I think the cover helps to keep the honey from flying over the can. The frames—that is, the combs in the frames—when in the machine are two inches below the top of the

the top, when the machine is not in use, to keep out all kinds of dirt.

To get something of an idea of the proper size of the machine, I had my son stand by the side of it. He has in his hand one of our honey-combs. He holds the comb by the bottom-bar. We set them in the extractor, top end down. That is the style of frame that we use the most of. We have 64 colonies in which we use two tiers of those frames.

Our extractors hold 70 lbs. of honey below the comb-basket. We have a pail 8 inches high that will hold 40 lbs. of honey, made like a milk-strainer pail, with one-half of the top covered, only we have a hole without the strainer. When we are at work extracting we keep the pail under the faucet, ready to draw honey into as often as we wish. Then we have a keg that holds 140 lbs. of honey—one head out. Over the open end of the strainer-keg we tie one yard of cheese-cloth; through the side of the strainer-keg, close to the bottom, we have a 1½-inch faucet. We stand one of our honey-barrels on end on the ground. On this barrel we place our strainer-keg. As we draw the honey from the extractor, we pour it into the strainer-keg on the strainer. By the side of the barrel that the strainer stands on we dig a hole about 5 or 6 inches deep, in which we stand an empty honey-barrel, with a funnel under the faucet of the strainer. We draw honey from the strainer until the barrel is full, when the barrel is plugged up tight, taken home and put into the honey-house. The plugs are not loosened, but stay just as they come from the field until sold. I think the honey will keep better if it is air-tight.

A REVERSING EXTRACTOR.

Now, what do I think about a four-comb extractor, and reversing extractors? It would be a great saving in time to have an extractor in which we could reverse the combs without taking them out of the machine, and I should have ordered one before now; but our frames are of an unusual size. The machine would have to be made specially for our frame, and would cost more. As I have never seen one of them, and don't know yet whether they are a success or not, I don't like to invest until I know more about them. The cut in the advertisement doesn't show any gearing, and I should think the motion would be too slow.

A FOUR-COMB EXTRACTOR.

I don't see much advantage in a four-frame machine. It would take as long to set four frames in a four-frame machine as it would in a two-frame machine, and as long to take them out; all the time saved would be in starting and stopping the motion, and that doesn't amount to much, and the machine would have to be larger.

E. FRANCE.

Platteville, Wis., Sept. 16, 1889.

Our readers will notice that friend France uses a different extractor, because he has out-apiaries. We have made extractors almost exactly like the one described above; but we discontinued adding the heavy wooden frame, because in almost every locality the bee-keeper can make it or buy it cheaper than to pay express or freight on it. Another thing, we always practice and recommend arranging the extractor so as to run the honey and strain it directly into the bung-hole of the barrel, thus saving the troublesome operation of lifting it up to pour it somewhere every time you get a

E. FRANCE'S HONEY-EXTRACTOR.

can; and here I think that the slanting side of the comb-basket has a tendency to throw the honey down and thus help to keep it from flying over the top.

THE SIZE OF OUR EXTRACTORS.

Our extractor-can is 2 feet 2¼ inches high, 22¼ inches in diameter, inside measure, across the top of the can. The frame is 3 feet 5¼ inches high; width, 2 feet and ¾ of an inch; 14½ inches from bottom of legs to bottom of can. The lower and upper bands around the frame are 5 inches wide. The other two are 2 inches wide; the legs are 1¼ inches square, all pine lumber. The top of the frame has a board cover, a three-cornered piece that covers a little more than half of the top. This part of the cover is fastened with screws to the top of the frame, and the gearing is fastened to it. There is a hole near the edge of this cover-board, through which the center-shaft of the comb-basket passes. Then we have another three-cornered board, with dowel-pins, to slip on the open part of

painful. The pail is almost sure to be neglected by somebody, and then what a mess, no matter whether it is on the ground or on the floor! Besides, lifting all your crop of honey by the painful is a tiresome, slow, and laborious operation. In the large apiaries in California, no such arrangement is tolerated. Where we have a great number of out-apiaries, however, it may be impracticable to have them all rigged so as to run the honey direct into barrels, or, better still, a large tank. In a good many apiaries, I have seen the honey-house located on a side-hill. The extracting is all done in the upper part of the building, while the basement contains the barrels, a large tank, or other receptacle. In California they often locate a large tank somewhere by the roadside, on lower ground; then when the honey is to be marketed it is allowed to run of itself into whatever package is decided upon, said package being already in the wagon, ready to be drawn away. No one should ever think of working an extractor that could by any possibility jump around. Ours have screw-holes and screws to fasten the extractor solid to a bench or box, or such a platform as may be decided upon. Extractor-baskets with sloping sides are somewhat more convenient; but the upper end of the combs furthest away from the central shaft will always be emptied soonest, or emptied more thoroughly. I believe the honey will never fly over the can if the combs are two inches lower than the top edge of the extractor. Large revolving baskets, made so as to swing the comb a good way off from the central shaft, do not need gearing; in fact, almost every body would eventually prefer them without; for in getting your combs a good way off from the shaft, you get the same speed without gearing that you would otherwise with. Most bee-keepers prefer to let the honey evaporate more or less by exposing it to the air, when the can or barrel should be open at the top. Friend France, however, has never found this necessary. Perhaps I should say that the above information of friend F. was given in reply to a series of questions asked by Ernest.

POISONOUS REPTILES OF FLORIDA.

THE BLACK GRAMPUS, ETC.

I SEE in August GLEANINGS an inquiry concerning the "black grampus" of Florida. This bug was one of the first of Florida's curious things to attract my notice when I came here three years ago. It is the *Thelyphonus giganteus* of the scientists; and, though very unlike the spider in habit and appearance, it is a member of the same family. Its home is in damp, rotting wood. Piles of refuse lumber that have been undisturbed for a few months are pretty certain to disclose a grampus when turned over. It is about two inches in length, and almost half an inch across the back; is brownish black in color, and has a front ugly and warlike enough to intimidate even a professional bug-catcher. The thorax is protected by a hard, polished coat of mail; and, in addition to three pairs of scratchy-looking legs, has a pair of claws and a sort of stone-crushing apparatus that would

do credit to a lobster. These claws each terminate in a pair of short curved needles, and are in every respect well calculated to hold fast all they can clutch.

The hind part of the body is soft, and ends in a slender, whip-like wiry tail, which is as long as the body, is carried upright, and furnished with numerous short, almost microscopic hairs, all pointing toward the terminal end. Near the root of this tail is a vent, from which, when irritated, it discharges a clear, acrid, malodorous fluid.

Its mode of attack and defense is to lacerate its victim with those horrible claws, and then, discharging this poison, it switches its tail over its back. The wiry, hair-set tail is well adapted to carry the venom and throw it into the wound. Its effect is not fatal to man or beast. I know a building-contractor who has been scratched by them several times. He says the pain is but little worse than that caused by a wasp or hornet sting, though the wound is longer healing.

Many of the negroes believe its bite to be fatal, and are much afraid of them; but it is generally considered harmless, unless you put your fingers or toes in its embrace. I shall be glad to send the first one I can find to Prof. Cook, and I hope he will give us a scientific description of it.

THAT SNAKE THAT BREAKS IN TWO.

I have never heard of the snake that breaks in two like a dry stick, and survives the break; and I venture the guess that it is one of the kind of snakes seen only by those who "look upon the wine when it is red."

No one need fear to come to Florida on account of venomous reptiles and insects. I have killed more snakes in Pennsylvania meadows in half a day's mowing than I have seen here in three years; and many persons have lived here for years, and never even heard of the grampus and scorpion.

Orlando, Fla., Sept. 6, 1889.

E. J. BAIRD.

This matter is certainly interesting to me. The idea that the grampus makes wounds with its claws and then throws poison into the wounds is wonderful; and it is especially interesting to those who have studied bees, because it is so nearly in a line with the wonderful phenomenon of the bee-sting. In regard to snakes that break in two, will Prof. Cook straighten us out on the matter? If I am correct, the *Scientific American* stated, some years ago, that there was a snake answering somewhat to these accounts; but, if I am correct, the part that breaks off is a horny substance, somewhat like the rattles of the rattlesnake. Of course, this part has no life in it, either before or after separation.

Hello! Here are some facts from a brother, right to the point:

THOSE SNAKES THAT BREAK IN TWO AND DO NOT BLEED.

I see that one of your correspondents talks about a snake that can be broken in pieces, the head run off, etc. Now, we have that fellow here, but not very common. When I first came to this country from Ohio, the natives used to tell about this snake, and I did not believe one word of it; but I soon came across one. They are from 18 to 24 inches long, and look very much like our common garter-snake when he first sheds his old coat—very slick and shiny, head longer and slimmer. It can run very fast in the grass, but can hardly cross a road

or run on bare ground at all; hence they are called by some, "grass-snakes," and that is how I got the first one. It was trying to cross a dusty road. I hit it with a small stick, and, sure enough, it was in two pieces, and I discovered I had found a joint-snake; then I proceeded to examine his snakeship, and proceeded to hit him and break him as square off as you could cut with a sharp knife until there was only three or four inches of the head left; then I discovered that that three or four inches of the head was all the body there was; the rest was tail; this short body could move a little, but make no headway. No blood came from breaking. I guess this will do for a snake.

E. MCINTYRE.

Memphis, Mo., Sept. 12, 1889.

Well, I declare! who shall say after this that there is any thing queer on the whole face of the earth, that some reader of GLEANINGS can not tell us something about? I can readily conceive that almost the whole body of the snake should be a horny substance like the rattles of a rattle-snake; but of course this horny substance that breaks in two without bleeding can have no muscles or motion about it. This being so, I do not see how the snake can crawl, unless the crawling apparatus is close to the head and pulls the horny body after it. Now, friend M., how do you know that the head part did not go back and hitch on to the other pieces, after you went away? Why does not somebody have one of these snakes in a museum, and break off a piece now and then for the entertainment of visitors? Prof. Cook, we need you sadly right here; and can you not, by offering a sufficient reward, get a grass-snake for your museum? If you can not get a live one, by all means get a dead one; and if you can not get a whole one, get some of the "connecting links," or even an inch or two would be quite an acquisition.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

GAURA COCCINEA.

I have received from N. M. Hallister, Fayetteville, Ark., a plant in bloom, of which he writes: "Bees are gathering bountifully of both honey and pollen from these flowers. The plant grows six feet high; has a smooth stem-stalk, and a whitish pink bloom. I have a field of buckwheat within three-fourths of a mile, yet the bulk of my bees go two miles, right past the buckwheat, for this plant, which grows on the river and lowlands. Please name it through GLEANINGS."

This is *Gaura coccinea*, a beautiful flower closely related to our northern fireweed or tall willow herb. I supposed it was a species of *epilobium* till Dr. Beal gave me the correct name. Thus we have another valued honey-plant from the "evening primrose" family.

A. J. COOK.

Agricultural College, Mich., Sept. 3, 1889.

DOES THE CASTOR-OIL BEAN YIELD HONEY?

Can any one who lives in a section of country where castor-oil beans are grown for the market, tell if the bees gather much honey from it? They work on the bloom here all day long, from the first

of June until frost kills, and that was last year after Christmas. They get pollen only late in the fall. The beans are not planted enough here to know whether it would pay; but I think they certainly would.

G. W. BISTLINE.

Mt. Pleasant, Texas, Sept. 5, 1889.

I believe the castor-oil bean does yield honey, but we have never had any reports in regard to the amount, so far as I can recollect. If any of our readers can tell us how much honey they get where the beans are raised largely for oil, we should be glad to hear from them.

COMBS BREAKING DOWN IN EXTRACTING.

I am in trouble concerning my extracting-combs. I have the heavy brood foundation, and wired frames as directed, and I have beautiful combs all straight and all sealed, made above a queen-excluding honey-board. They are the Simplicity frames, but my combs all break down in the extractor. I have the Novice extractor and honey-knife; and when I uncap them the cells are easily broken from the foundation, and it all breaks out of frames and wires, and settles into the wires of the extractor. I have worked hard to have my combs up to science this year. The honey seems heavy, and cells tender. Are mine too new? Do I have to work two or three years for old tough combs, or is it because I don't know how to uncap? Please fully explain my trouble, or refer my letter to some who will. I get the honey from only one side, and then all breaks down. How I should love to visit Mr. France's apiary! You were there, so please explain my trouble. I am getting beautiful comb honey. My working colonies have averaged 150 lbs. a colony, and they are just finishing the second crop of alfalfa; and next month we shall have the third crop of it.

Delta, Col., Aug. 9, 1889. MRS. A. A. HODGDON.

I am quite at a loss to understand why your combs broke down. I have never heard of such a thing with wired combs, and we often extract them when they are not half built out, or only half fill the frames. Do you not turn the extractor faster than is necessary to throw out the honey? If you turn too fast in emptying the first side, the combs will sometimes settle down into the wire cloth, especially if the weather be very hot. At such times we have extracted part of one side, then the whole of the other, and lastly throwing it all out of the first side. Perhaps your honey is extra thick.

THE WEIGHT OF THE DOVETAILED HIVE; HOW TO TELL HOW MUCH TO FEED TO EACH COLONY.

Please give me the weight of a Dovetailed hive, with frames, top and bottom boards; also weight of Simplicity No. 6, as above. I wish to determine the amount of honey in hives, for winter use. Will you kindly tell me how?

J. B. ENOS.

Connellsville, Pa., Sept. 9, 1889.

Our No. 1 Dovetailed hive, as per our price list, weighs about 30 lbs.; the No. 2 Dovetailed, about 40; and the No. 6 Simplicity, 50 lbs. An average Langstroth comb, filled, contains about 5 lbs. of capped honey. Estimate from this the proportionate amount in each comb. Their sum subtracted from 20 to 30 lbs. of honey (the amount usually allowed per colony on summer stands), will give the amount required

to be fed. A little practice in "hefting" and estimating will enable you to become correct enough for all practical purposes.

HOW MUCH CAN WE AFFORD TO PAY FOR A COMB-HONEY PACKAGE?

Will it pay to invest, at a cost of 1½ cents per lb. for comb honey? Could I get my money back by an increased price for my honey?

Canadice, N. Y., Aug. 2.

L. M. DOOLITTLE.

The question as to whether it will pay to invest a cent and a half a pound for a package to hold comb honey, in addition to the price of the sections, is a hard one to settle. You would have to determine, as nearly as you can, how much the honey costs you to produce it. Knowing the market price you could then decide for yourself better how much you could afford to pay for a package. Of course, you want to reserve as large a margin as you can, after getting the honey upon the market.

A BEAUTIFUL SPOT.

Bees are not doing much here now. Forest fires are raging in the mountains, and will destroy the most of the fall bloom. Many a stray swarm will have to pay for its folly with its life, that sailed gracefully away amid the ringing of bells and a great blast of trumpets for their new home in the forest, while a very sorry looking bee-keeper stood with his hat off, trying to keep cool. The timber on the mountain in front of my place is enveloped in flames. It is a grand sight, as the mountain is about 9000 feet high, and the timber extends up for 8000 feet. The burning forest is at night reflected from 13 mountain lakes around its base, while Mt. Shasta and Lassen's Peak stand to the north, wrapped in a mantle of snow. Who wouldn't be a bee-keeper in the Sierra Nevadas? I think if A. I. Root were here he could listen to the songs of birds and the music of the falling waters to his heart's content, and gaze into crystal lakes that would equal any thing he saw in Southern California. I almost forgot to mention the speckled beauties that he would find in their native haunts. Think of camping on the shores of a beautiful mountain lake, and wandering over grassy slopes to catch a mess of trout for your breakfast. G. W. COVER.

Downieville, Cal., Sept. 2, 1889.

I know I missed a great deal in not visiting the northern part of California, especially round about San Francisco; but when I make my next visit I will try to give you a call.

BEE-STINGS A CURE FOR RHEUMATISM.

I see there is one adverse report by Mrs. John Burr, in regard to bee-stings for rheumatism. Would she expect to be cured of so serious a disease by one or two good stings, or one or two doses from the best doctor in the land? Let her persist in keeping bees, and get stung a few years as much as I have, and she will have to die of something else. I had noticed, before this thing was mentioned in the bee-papers (to my knowledge), that my rheumatism was playing out, and that I should never get a pension on that if it didn't return, which I think there is no hope of, as long as I keep bees, for I have no small help to keep the smoker going; and, my word for it, I would rather take the punishment that Sullivan gave to Kilrain than to face it sometimes. But at the same time I

would rather stand stings than rheumatism, and have pain enough to draw your arms, legs, and muscles, up into knots.

Pine Grove, O., Sept. 7, 1889.

S. DANIELS.

HOW TO KILL A SWARM OF BEES.

Will you kindly give me your advice as to the best way of killing a swarm of bees when their winter supplies are too small? I am a friend of the little fellows, and a new hand in the work, and I should like to have your advice.

G. H. GILBERT.

Martell, Wis., Aug. 30, 1889.

Why, friend G., if you are a friend of the little fellows, what do you want to kill them for? Modern bee culture does not include any process for killing bees. Instead of buying brimstone, we now buy sugar; and the bees are almost certain to pay back the money with good interest, the very first season, what the sugar cost. If you can't keep bees without wanting some process to kill them, excuse me if I suggest, in a kind and friendly way, that you give up the business.

A NARROW (?) ESCAPE.

Mr. Root:—You came very near having to pay the thousand-dollar reward; but your time is too valuable to go into all of the details. It was claimed by one of the "smart Alecks" who know every thing that is going on, that he knew a man who could make the comb and fill it with honey, as he saw it done. So I asked for the man's name, and he mentioned one whom I knew very well. So I sent a boy to friend H., and got them together. To sum up, he saw him making foundation and extracting honey, and that was all there was of it. How ashamed he was, after it was explained to him! Perry, N. Y., Sept. 8, 1889. JOS. R. WRIGHT.

RAISING QUEENS ABOVE PERFORATED METAL.

I have had some experience with raising queen-cells over a zinc honey-board. It worked well till the last batch; out of curiosity I looked at them four days before they were to hatch, and found three torn down. I cut out all but one, and left it to see what they would do with it; in 48 hours I looked and it was gone. No queen had hatched to tear them down. The honey-flow had partly failed, but they were still storing some surplus.

SHIPPING HONEY.

How should honey be shipped—by freight or express? and would distance make any difference? This is the first year we have had a crop since 1886. We have never shipped any. Our home market is full of 10-cent honey; we have no such for sale.

The Ignotum tomatoes are doing fine; they are the best-flavored tomatoes I ever tasted.

Swedona, Ill., Sept. 4, 1889.

S. F. TREGO.

I believe the general decision is, that honey of all kinds should go by freight. Express is expensive for any thing that is not worth more than 15 or 18 cents a pound; and although express should be safer than freight, experience seems to indicate that it is even more apt to be injured than by freight. But be sure to put the ends of the sections toward the locomotive.

RUBBER ROOFING IN LIEU OF TIN, FOR HIVES.

Please answer through GLEANINGS what you think of this rubber roofing that is used to cover buildings. Would it not do to use to cover beehives? You know how it is about leaky covers to hives. I believe this roofing is the very thing. It is

cheap, and much better than tin. I have not used any of it. I have just received samples, and I believe it will answer the purpose. You see any kind of lumber can be used that is picked up, almost, and make a good cover. C. H. MCFADDEN.

Clarksburg, Mo., Sept. 7, 1889.

I have never seen any rubber roofing that was a success for any length of time. I do not believe there is any thing made that would compare favorably with tin.

CHAFF-HIVE ENTRANCES TOO SMALL.

I was visiting a bee-keeper lately, and had quite a discussion with him concerning the hives he was using. He had 107 stands, I believe, and only about 12 or 15 of them were chaff hives, while the rest were Simplicity. He told me that there was not room for ventilation in the chaff hive, with an entrance $8 \times \frac{3}{4}$ inches. He says it is almost impossible to keep the bees inside in very hot weather. I have had the same trouble this summer. I have 26 chaff hives, and with all the shade I could give I would frequently have the front of the hive covered with bees. Will you please tell me what is the matter? My bees have given little or no honey this year. I am proud of GLEANINGS, and wish it and its publisher success. S. R. HOLBERT.

Watson, W. Va., Sept. 5, 1889.

Our chaff-hive entrances heretofore have been too small, and we now make them the full width of the hive. The clustering on the outside has been caused largely by entrances being too small.

SKUNKS AND BEES.

Skunks sometimes trouble me late in the fall. One hive has a place where they have scratched more than a fourth of an inch deep in the front of it. When grasshoppers, crickets, and the other bugs and worms they live on are mostly gone, they go for the bees. I use a box trap to catch them. One fall I caught four. They seldom scent if drowned in a trap, and their hides and oil in November are usually worth from 75 cents to \$1.50 each. J. L. HUBBARD.

Walpole, N. H., Sept. 11, 1889.

SKUNKS; AN EASY WAY OF CATCHING AND KILLING THEM.

To help friend Doolittle and others out a little, I will tell him how to destroy these pests. Some years ago, when I lived in California, I set traps to catch foxes, and soon caught, in all, 13 skunks in box traps; but to get clear of them without spoiling my traps, and not have other disagreeable results, was a question at first difficult but afterward easy to solve. I will now talk direct to Mr. D. Make a box trap of the old-fashioned kind, with a fall lid, say 10×10 inches, and 2 ft. long. Smear a fresh egg on the bottom and inside. Bait with an egg, and set near your bees where the skunks come. The next morning you will be pretty sure to have the gentleman. The terrible odor of a skunk is his weapon of defense, and is never used except as a last resort, and in an emergency. As it is as offensive to themselves as it is to any thing else, no fears need be entertained. Pick the trap right up under your arms, on your shoulder, or in any way, and carry it as far as you wish, only handle it without thumps or jars. Into a pool of water fully large and deep enough to surely cover the whole trap, immerse it and hold it there five minutes, and very

seldom any smell will be raised at all. Once in a while one will give a scent when immersed in the water, but not often; but you need have no fears in handling the box so long as you do it gently. I handled the thirteen so, without any trouble.

A. A. FRADENBURG.

Port Washington, O., Aug. 2, 1889.

MINERAL WAX; SOMETHING FROM ONE OF OUR SUBSCRIBERS IN THE REGION; SEE GLEANINGS FOR JULY 15.

I live about 20 miles from the wax referred to in the clipping. This is the only mine from which wax has been shipped, as yet, in this region. The mine has been worked about 3 years. This is nearly pure asphaltum. It is sent to Price Station, 100 miles, in wagons. The mountains near Price River, on the D. & R. G. R. R., also abound in mineral wax of various kinds. The best is elaterite, or mineral gutta percha; ozocerite, and others of less value. There are large quantities containing paraffine wax. This, in its crude state, is good chewing-gum. These latter have just been discovered, and are still undeveloped. They are all jet black, and nothing like beeswax, and never will compete with that article. There is no other wax of that description in Utah, that I know of. BART BARTLETT.

Vernal, Utah, Aug. 26, 1889.

Many thanks, friend B. Near the Ojai hot springs, in the vicinity of San Buenaventura, I saw mineral wax, or bitumen, exuding from the hills in such quantities that for quite a distance it made a hard roadway for the horses. At other points it was so soft that the turkeys got it daubed on their feet, and were in great distress because the leaves, feathers, and every thing else, clung to them so as to impede their walking. This wax was, however, as you say, black, and nothing like beeswax. I am inclined to think, however, that there is something somewhere in these great Western wilds that is a pretty fair substitute for beeswax and paraffine. Can anybody else tell us about it?

HONEY FROM GROUND IVY, AFTER JACK FROST.

Last fall, after Jack Frost had already destroyed all visible flower life, I prepared to store away my pets for the long dreary winter; and upon an inspection several days thereafter, I found, to my utter surprise, enough uncapped honey to equalize three pounds, in the hives. The question now arose, Where did this honey come from, and where did the bees obtain it? As the honey-house was intact, they did not get it from that source. After close watching I noticed the bee-line leading toward the river; and being well posted about the surrounding flora I skirmished the country over hills and valleys, but all in vain, as the frost had done its work completely. At last, and not far distant from my house, I found my truant yellow jackets busily engaged on a heavily overgrown piece of ground ivy, *Glechoma hederacea*, the tops of which, being affected by the frost, yet left the lower parts in a good state and in full bloom. On tasting the honey I found it to be very bitter; and fearing it to be injurious to my bees I extracted it and destroyed the plants. The honey granulates easily, and is of a greenish-white color. As stated before, I obtained three pounds. In its proper soil, the plant becomes of a strong, creeping growth, the blossom being of a blue, purplish color, and is one of the

last to be destroyed by the frost. I inclose you a sample of the plant. CHRISTIAN ILLIG.

New Athens, Ill., Aug. 12, 1889.

If you are talking about the same plant described in the A B C book, under the name of gill-over-the-ground, I am surprised that you find the honey bitter. In our locality there is seldom enough of it to extract, but the flavor is not at all unpleasant. It is, however, a terribly bad weed, and on that account I think you did well in destroying it.

JAPANESE BUCKWHEAT IN EIGHT WEEKS.

I sowed the peck of Japanese buckwheat I got of you June 20th, and send you a sample picked eight weeks after. Of course, it is not all ripe, but will be before long. I sowed it on 50 rods of ground, and it is too thick. It stands from three to four feet high, with blossoms on branches nearly to the ground, and is filling nicely. Bees worked on it well in the forenoon each day. I have sown a few kernels for a second crop.

Our honey crop here is about half what we expected, but the quality is good. Bees had the worst kind of swarming fever, but basswood bloom was of short duration, and then swarming ceased.

Linden, N. Y., Aug. 20, 1889.

E. L. EIGHMY.

REMINGTON'S PHARMACY; MORE FALSEHOODS.

Remington's Pharmacy was copyrighted in 1885. I have the 1888 edition. Joseph P. Remington, the author, is professor of theory and practice of pharmacy, and director of the pharmaceutical laboratory in the Philadelphia College of Pharmacy. He was also first vice-chairman of the committee of revision and publication of the U. S. Pharmacopoeia, and pharmaceutical editor of the U. S. Dispensatory. J. B. Lippincott & Co., Philadelphia, are publishers. On page 279, speaking of mellita, or preparation containing honey, he also says, "Their advantages over syrup are not very apparent, particularly since of late years the difficulty of obtaining pure honey has greatly increased."

GEO. F. WILLIAMS.

New Philadelphia, O., Aug. 20, 1889.

HONEY-BOARDS; THE DIFFERENT KINDS OF QUEENS.

I should like to know whether or not there is a patent on the break-joint honey-board, queen-excluder, and Heddon hive. Also, what is meant by mismated, untested, warranted, and tested queens?

CHAS. S. LEWIS.

Litchfield, Ill., Aug. 14, 1889.

There is no patent on the honey-board. Mismated queen means a hybrid, or a queen which is supposed to be an Italian herself, but has met a black drone. An untested is one that is a pure queen herself, but no guarantee is made as to whether she has met a pure drone; she has been laying only about a week. If kept in the hive three weeks or a month, and her workers are pure, she is called tested. A warranted queen is an untested queen, but the breeder guarantees that she will prove to be pure. If in the hands of the purchaser she turns out to be a hybrid or a "mismated," the breeder agrees to send another until he succeeds in sending a pure queen. As there is a good chance for jangles, and also a chance for a customer to claim his warranted is a

hybrid when she was not, we have never sold queens in that way. Sell goods for what you *know* them to be, and you will avoid many disputes.

BEES AS THICK ON RED CLOVER AS ON WHITE.

Bees are gathering enough honey to keep them from robbing, and to carry on queen-rearing nicely. I was wondering where they were getting it; and so, yesterday I took a walk at 1 P. M., to a twenty-acre field of red clover, about one-fourth mile from my apiary; and I must say that I never saw bees as thick on red clover before. They were as thick as I ever saw them on white clover. I caged twenty queens this afternoon, beginning at 2, without any robbing at all. May God be praised for his bountiful blessings.

J. P. MOORE.

Morgan, Ky., Aug. 27, 1889.

RED CLOVER A HONEY-YIELDER IN MISSOURI.

I notice in the answers to Question 136 that a large portion of the writers seem to consider red clover of very little importance as a honey-producing plant. This year, at about the time that honey ceased from white clover, we had a field of red clover in full bloom (the second crop), and I am sure I never saw bees more busy on white clover than they were on that field of red clover. My opinion is, that if all the honey secreted by red clover could be gathered it would yield more honey per acre than any other flower that grows in this part of the country; for I have for years been in the habit of examining heads of red clover, and seldom failed to find nectar that could be seen and tasted. I have also often examined the heads of white clover, and tried to discover honey, but have never found enough so that it could be seen or tasted; and if I did not know that it does produce honey, I should say that it contained very little. Now, let the old heads say what they will; but if red clover were as plentiful as white clover is here, and I had bees that could reach all of it, I could show some big crops of honey. But there never was, is not, and, I think, there never will be, a honey-bee that can get all of the nectar secreted by red clover.

Bluffton, Mo., Aug. 24, 1889.

S. E. MILLER.

BEES POISONED BY A PIE-MAKER, BECAUSE OF THEIR ALLEGED NUISANCE.

I take the liberty to ask you for your opinion in a matter in which I know you are interested. A gentleman from Baltimore, director of a pie company, called on me the other day and asked me the best method of getting rid of bees which had so invaded his factory, on the outskirts of the town, as to cause him great annoyance, pecuniary and otherwise. He stated that his company had been turning out 20,000 pies a day. He employed some 20 hands, besides 10 wagons and drivers; but in consequence of the bees, which crawled all over the pies, died in them, and made them unsalable, his business had considerably decreased, and he was now making only 3,000 pies daily. He stated that the nearest apiary to him was 10 miles away; that he had driven round for three or four miles, making inquiries, but had discovered no bees. I asked him if he was in the neighborhood of woods and hollow trees. He said there were several round him. The bees were black. I concluded they were wild bees, and I reluctantly advised him to use poison, supposing that he was not injuring anybody's trade, which he was particularly desirous to avoid. Nevertheless I ask-

ed him, before resorting to such an extreme measure, to be so good as to wait until I had consulted good authority as to the best steps to take; and as it is much to the interest of the bee-keeper to protect a business that is evidently suffering, I should feel much obliged to you if you would kindly suggest a remedy.

FREDERICK L. CURTLER.

Alexandria, Va., Aug. 8, 1889.

The pie-maker is greatly mistaken. Bees could not possibly go ten miles to bother him, and I very much doubt if they go one mile. His complaint, as you give it, would seem to indicate that his trade has gone down from some other cause, and he is seeking to saddle it upon bee-keepers. The number of bees he poisons can not do any harm, I think, even though there is an apiary within one mile of him. I should tell him to poison them if he chooses. Very likely the nuisance has all abated before this reaches him. When bees in large numbers are kept, say, within $\frac{1}{4}$ mile or nearer, they sometimes prove annoying during a drouth, or when there is no honey to be had, but such things are an exception and not the rule. If you could visit his establishment I am quite certain you would find he is greatly exaggerating the matter in regard to the bees doing him harm financially.

BUCKWHEAT HONEY; WINTER PACKING; UPWARD VENTILATION.

1. Do you consider it advisable to make your bees winter on buckwheat honey, if you have plenty of it?

2. What material is best for packing a double-walled hive above and at sides?

3. Is upward ventilation desirable for outdoor wintering?

C. H. HOYT.

Irving, Mich., Aug. 5, 1889.

1. Buckwheat honey, if well ripened, is as good as any honey for wintering. White honey is preferred, as a general thing; but so far as we are able to discover from reports, bees winter about as well on one as on the other.

2. Wheat chaff is about as good as any thing for packing around hives. It is light and porous, and in most localities it is the best and cheapest. Almost any porous material such as chaff of any kind, or sawdust, will answer tolerably well.

3. Upward ventilation, aside from what is obtained through the chaff cushion, in outdoor wintering, is not necessary. Give them a good full-width entrance and they will have all the ventilation they need. Upward ventilation, both for outdoor and cellar wintering, is now generally abandoned. Plenty of bottom ventilation seems to be all that is required.

TO BIND GLEANINGS.

Take a strip of heavy manilla paper, pasteboard, or light tin, 1 inch wide and $10\frac{1}{4}$ inches long, for a pattern; make a line $\frac{1}{4}$ inch from one edge. Start the first hole on the line with an awl or punch, $1\frac{1}{4}$ inches from one end (mark that "top end"), and make the rest of the holes $1\frac{1}{4}$ inches apart (6 in all). Lay this pattern on a copy of GLEANINGS, the edge closest to the line parallel with the back edge of the book. Mark through the holes of the pattern with a pencil or awl, then take six copies and prick through as marked, with an awl, and sew together

with a running stitch. Six copies are nice for reading or reference. When the year is up, cut the stitches and sew 24 together. A cover made to suit your fancy may be sewed on at the same time. The above-described pattern is to make all the holes for stitching alike. No matter how many packages you make, it forms a square book, provided you punch the holes through every six copies straight.

W. Lewisburg, O., Aug. 19, 1889.

F. WEHE.

In my travels I saw GLEANINGS many times, put up in home binders. At Thomas Arundel's, in California, whole volumes were so neatly arranged with ornamented backs, that I could hardly believe they were home-made.

QUEENS FERTILIZED ABOVE THE ZINC NOT A SUCCESS; A CORRECTION.

In GLEANINGS, page 685, in your comments on Heddon's paragraph, you evidently made a mistake in saying that he had "succeeded in having a queen reared and fertilized above the perforated metal." In the paragraph quoted, the queen was reared, hatched, and fertilized below. You will notice that the statement in nowise differs from the views I have expressed on the subject. I have had the same experience over and over; but in numerous trials I never had a queen fertilized above the excluder without a coincident loss of the old queen below. It can occur only when the queen in the brood chamber is about to be superseded. You will see, therefore, that the idea you have conveyed may lead some one to try that very thing and fail also. There is no fact better established, than that a queen can not be "reared and fertilized above the perforated metal" while a good laying queen is below in the brood-chamber. It may be possible in a good honey-flow, but we have had no honey-flow in this locality good enough for it to be possible, in the past four seasons that I have tried it.

G. L. TINKER.

New Philadelphia, O., Sept. 2, 1889.

Thanks, friend T. We accept the correction; but it is true that Heddon, as early as 1885, or perhaps earlier, had cells reared and hatched above the excluder. But some one, it seems, has anticipated Heddon on this point. See a short article from A. A. Fradenburg, pages 742, 754, Sept. 15.

IN FAVOR OF CARNIOLANS.

During the present season I have been testing several different races of bees in the same yard, and find that the Carniolans are away ahead, and will give me quite a nice crop of surplus. This is my second season with them, and thus far I am very much pleased. I find them peaceable, industrious, and very prolific, gather but little propolis, and, so far as my experience goes, they winter better than the Italians. I have had considerable experience with bees, having kept them from my boyhood up to the present time. I had at one time 118 colonies, mostly Italians, and their crosses. I have also tried several races, with more or less satisfaction.

T. I. DUGDALE.

West Galway, N. Y., Sept. 3, 1889.

THE SENSITIVE PLANT THAT BEARS HONEY.

I send to-day some seeds and specimens of leaves and flowers of *Mimosa pudica*, or sensitive plant; very rough seed-pod, flowers globular, about $\frac{1}{2}$ inch in diameter, very sweet flavor, probably a pollen-plant. Bees love to climb all over it and wal-

low all round it. It is of a fine red color, leaves delicate and very sensitive. It will close at the least touch, especially in a warm dry day. I also send an allied species of mimosa flowers, loose, and sheaf-of-wheat shaped, quite sweet-scented (less so than the pudica), less pollen; seed smaller; pods long, smooth; very slightly sensitive; blooming a few weeks later; plants more numerous. Both begin to bloom in May, and are now covered with the terminal seed-pods. I found a few fresh blossoms this morning. I shall try to send you a *root* of the pudica. I think it will live and reach you. Numbers three, one, and three, two, are what are here called white and yellow primroses. My attention was attracted to them by their abundance and beautiful bloom, and especially by always [in June (and before and after)] seeing the bees getting (perhaps honey) surely pollen from them. I saw and heard the bees more and oftener on this yellow flower, never once on the horsemint. Perhaps I was not early enough in the morning for them. No. 4 is a sprig of a rather tall (say 2 or 3 feet) perennial shrub, mimosa. It blooms very abundant, covering the stem and the very end with its light-red globular sweet-scented blossoms. Its fruit is a small flat pea-pod. It blooms in April and May. I happened to find this sprig this week.

I first noticed, April and May, 1879, that the mountains were covered with this mimosa, and gave a sweet scent, far and wide.

No. 5 contains a few blossoms of a plant that the bees climb and roll over, and wallow through its pollen. I do not know its name, and have no botanical dictionary here. These flowers, though, one and two, are acid, much like the wild strawberry (not the edible fruit, but a weed whose name I can not now recall) in their numbers and rank in plant life, and are perhaps too small and unimportant to be of much use to the bees. But I write and send you the mimosa pudica, or sensitive plant, and just add the rest.

EDWIN LEIGH.

Center Point, Tex., Aug. 3, 1889.

I should suppose that, when the bees touched the flower, if it is like the sensitive plants we have around here in our green-houses, it would double up and lie down, unless, forsooth, it learns to distinguish between the human touch and the bump of a busy bee. Thanks for the plants and seeds. We will try to test them.

THE CLOVER BLOAT AND THE WOODEN BIT A SURE CURE.

I assure you that the round-stick cure for hoven will save the cow every time. It is so simple that people can scarcely believe it; and yet a piece of broom-handle for a bit, and two wool-twine strings to hold it in the mouth, will drive any man with a nose out of the yard where the cow is. You would not hold the stick long, I assure you. There is no need of putting a knife into a cow's side. Open the mouth, and the pent-up gas will escape.

Perrysburg, Ohio, Sept. 3, 1889. G. A. ADAMS.

HOW TO CURE CLOVER-BLOAT WITH A CORNCOB.

The remedy for clover-bloat was published some years ago, I think in New York *Tribune*. Happening some time after that in Berlin I stayed with a farmer who came one afternoon in great excitement to me to know if I knew anything about bloat, he having 3 cows lying beside the fence, on their sides. Trocar, no one knew anything about, nor

any other remedy; so I took a good corncob, put one in each cow's mouth, crosswise. Then I got a stick, as described in your article. By rubbing the sides of the animal with a rough round stick it did not take very long, when they were on their legs again, and got over their trouble. F. J. M. OTTO.

Sandusky, O., Aug. 26, 1889.

OUR QUESTION-BOX.

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 145.—*Has your experience with commission men been satisfactory? If not, state in brief some transactions, not mentioning names—transactions that will serve as a warning to some of the novices.*

I have patronized home markets only.

A. J. COOK.

It has not. "The other fellow" may give the experience.

MRS. L. HARRISON.

Yes, where such men have a good rating with Bradstreet or Dun.

G. M. DOOLITTLE.

My experience with commission men in selling honey has been entirely satisfactory to me.

GEO. GRIMM.

Yes, reasonably so; but my honey dealings with commission men have never been very extensive.

O. O. POPPLETON.

I have been swindled by only one; but since, I am careful to inquire of the responsibility of the parties before shipping, and have had no trouble since.

P. L. VIALLO.

Yes, and no. Perhaps "yes" would be as appropriate an answer as I can make, taking all in all, without going into details. As a rule, commission men are human beings. I find there is a difference in men.

A. E. MANUM.

Yes, but they have never handled any honey for me, except to buy it and pay for it like other people. They have sold produce of the farm, and large quantities of preserved eggs, to better advantage for me than I could. Deal with honest ones only, or sell for cash.

DR. A. B. MASON.

I have been well used by commission men. This, however, does not change my preference for selling outright for cash. I know there are some very honorable men in the commission business, and I judge there are others just the opposite, as in other kinds of business.

P. H. ELWOOD.

My experience with commission men in selling my honey has been very limited. I have always thought best to do my own selling. I do not wish to sit in judgment upon commission men as a class. I take it they are like the average of mankind, good, bad, and indifferent. If I were to sell my honey on commission I would try to send it to a good man.

H. R. BOARDMAN.

While my experience has been satisfactory, I wish to find fault in one particular. The best quality of $\times \times \times$ honey will not sell at the highest quotations. It seems that commission men have a *habit* quotation to induce bee-keepers to ship their honey to them, and then sell one or two cents low.

er. I think they should say what quality and what package brings the best price. I speak particularly of extracted honey.

RAMBLER.

Yes, we had trouble in the beginning, because we shipped to everybody's man, and too largely. We have special commission men, and ship to them only what they think they can readily sell at our figures. The great trouble with commission men is, that they get overstocked before they know it.

DADANT & SON.

We have had some deal with commission men, and so far we have no reason to complain. We sent four barrels of honey to a firm in Milwaukee. I told them to take all the time they wanted to sell, and do the best they could to get a good price. They held it about four months, then sold at good figures, and paid promptly. We sell most of our blackberries through commission men, and so far I have had no trouble or reason to find fault with them.

E. FRANCE.

We learn to know men best when doing business with them. There are very respectable commission merchants, and there are scoundrels among them, the same as there are among any other class, of men. Bee-keepers as a class, are, in my estimation, if not superior at least on a level with any other class I know; yet there are scoundrels among them. Don't let us run down a respectable calling, because there are black sheep among all flocks. Don't let bee-keepers be guided by flattering offers, but let them endeavor to deal with honorable men.

C. F. MUTH.

More satisfactory than otherwise. One firm ordered a little on trial. It sold at a great big price. With the returns the statement was made that they could sell large quantities of it at the same figure; but when the larger lot arrived they could hardly sell at all, even at a low figure, although quotations were about the same all the way through. Reports of light weight were made in some cases, where I knew it must be a mistake. When I have named a price below which they must not sell, and asked them, on receipt of the goods, to acknowledge the goods and name the price set, they have uniformly refused to name the limit of price, so they can sell as they please; and I heard one of them laugh at the idea of the owner setting the price, as if the merchant did not know best what it ought to bring.

R. WILKIN.

a. No; b. Commission men are the same as other folks—good, honest, and otherwise. I have found it more satisfactory to ship to one making a specialty of honey than to one handling every kind of produce, as they better know what it should sell for. In one instance the past season I sent a small lot to a party for trial. They were not regular dealers in honey. They sold a part for four cents per lb., which, of course, was not satisfactory. A few years ago I sent a large consignment to a man in New York, doing a large mixed business. After waiting six months I was obliged to have him turn it over to a regular honey-dealer, who disposed of it in a few days.

S. I. FREEBORN.

In some cases my transactions with commission men have been unfavorable; but as a whole, quite satisfactory. I believe it might be better if there were some arrangement whereby the consignor could know if he wished whether the commission man made honest returns. I knew of one man who

reported always the name of the person or persons to whom sales were made; but it may be this could not be made to work satisfactorily. Some commission men make a practice of erasing all marks that show by whom the honey is produced, and seem to fear having the producer and the retailer known to each other. I think it might be better for commission men and all if no attempt at secrecy were made.

C. C. MILLER.

As a whole, it has. Three years ago I shipped honey to fifteen different commission firms in almost as many different cities. In comparing the returns, I decided that all had dealt fairly and honestly with me. While commission men have sometimes sold my honey too low, as I thought, I have no reason to suspect dishonesty in any of my dealings with them. I was always careful, though, never to ship honey to a firm that I did not know to be in good standing. We would not trust every stranger who came along and wanted to buy of us on credit, and we should exercise the same care in sending honey or other produce, to be sold on commission. The past two years I have bought considerable honey of commission men, and this dealing on both sides has but the more firmly convinced me of the foregoing.

J. A. GREEN.

I have had some most satisfactory deals with commission men. I know that they are not all rogues. I know that many times they find it impossible to dispose of our goods at the price we hold them to, and oftentimes at any price. There are a good many terribly weak-minded men in the bee-business. Some of them think *their* goods are the most salable in the world, which is not the case by any means. Commission men are good for the country. They fill an avenue in the commercial world which no other class of business men can. We should not expect human nature to work as well for others as it works for itself. It is not best it should. If all men were as willing to serve other people as to serve themselves, the wealth of the world would pile up into fewer hands much faster than it does. The inspiration of ownership is a grand element in human nature. He will sell goods quickest who owns the goods. The ownership of happy homes is a grand thing. Every man should own his home; then we shall have a country of patriots.

JAMES HEDDON.

My experience with commission men has been entirely satisfactory. They have let me entirely alone, and I have let them entirely alone. My largest shipment of honey came out thus: A family in Columbus heard of my honey and wanted some. A lady friend, who was a customer of mine, having put the bee in their ear, I earnestly advised that they buy in the Columbus market—as, if they paid a little more, it would be more than balanced by freedom from risk and worry. My advice was without avail. Our mutual lady friend devised the plan of having a well soldered tin trunk made, and filled with sections. Then, you see, if the honey was broken somewhat it would be in there any way. Well, in the course of time the trunk arrived. It had been opened on the route. Some of the sections were gone altogether, and the rest, in its broken condition, was not an attractive sight, I judge. While honey in glassed cases may be broken in transportation, I suppose that, when packed so as to be out of sight, it is pretty sure to be.

E. E. HASTY.

I am glad to see that our friends as a rule show a charitable disposition toward commission men, whether they patronize them or not. It is surely wrong to condemn a whole class of individuals because their line of business is such that bad men may easily take advantage. For instance, it is quite customary to denounce jewelers as a class of cheats; but it is very foolish, notwithstanding; for we have conscientious, fair, and honorable men—a good many of them—in the jewelry business; and those who build up a large business are almost invariably of this class. Friend Doolittle suggests Bradstreet and Dun. I think there is an excellent point there, in more respects than one. The commission man who is rated as a man of means, and one prompt in his payments, would never have built up such a business had he not been straightforward and honorable. C. C. Miller makes a suggestion which I think is valuable. If you can find a commission man who is willing not only to tell what the goods sold for, but give you the address of the purchaser, he is certainly the one to be recommended. And I should say not only in the commission business, but in every other business in the wide world, the man who has no secrets, and nothing to be kept back from his patrons, is the one to deal with. It is like tearing away the fences around our dooryards. It gives us glimpses of a better time coming; and I think almost every neighborhood is beginning to agree that no fence at all gives better results than stone walls eight or ten feet high, with sharp spikes on top of them.

ANSWERS TO QUESTIONS

FROM OUR A B C CLASS.

This department is designed primarily to cover questions either not already answered in the A B C of Bee Culture (price in cloth \$1.25), or, if incorporated in this work, are here dwelt upon more in detail on account of the importance of the question. While these answers are of vital interest to the A B C scholars, they will doubtless be found, in many instances, to be of considerable value to the more advanced student. For lack of space, the question itself, instead of being directly stated, is omitted, the same being implied in the answer. It is hoped that the class will first consult their text-book before sending in their questions.

THE SPRAY-DIFFUSER.

D. L. C., Michigan.—The spray-diffuser is a little small, but with it you can in two minutes spray a whole colony, if it works clear. We discarded the spray-diffuser altogether in treating foul brood. Don't waste your time in trying any other plan than the starvation method. You can cure it after a fashion with phenol or carbolic acid; but it is long and uncertain in its results. We have so advised in GLEANINGS.

J. A. W., Iowa.—Bees do not gather glucose unless the same is put within their reach by man. But this would not pay, even at the low price of the article. Glucose can be mixed by man, with extracted honey, but would not pay, and is, we venture to say, rarely if ever practiced. Tell that commission man that all the commercial glucose that bees gather from flowers, is in his imagination. Tell him also that the honey you sent him is pure, and was sent just as it was taken from the flowers.

WHEN TO PUT IN DIVISION-BOARDS.

W. H. M., Pennsylvania.—The time to take out the brood-frames from the brood nest, and put in division-boards, should depend upon circumstances. If the colony is strong, you might not need to take out any frames at all. The general rule is to give bees on only as many frames as they will cover comfortably, and fill up the empty space with division-boards or chaff. Brood-nests for winter should be contracted about the middle of fall—earlier or later according to circumstances.

NOTES AND QUERIES.

We solicit for this department short items and questions of a practical nature; but all QUESTIONS, if accompanied by other matter, must be put upon a SEPARATE slip of paper with name and address.

BEES BITING THROUGH THE TOUCH-ME-NOT.

The honey-flow still continues. My bees have made a great deal from the large thistle, and are now working on touch-me-not and fireweed. The Italians bite through the tongue of the blossoms, as described in the A B C. S. J. YOUNGMAN.

Lakeview, Mich., Aug. 31, 1889.

POLLEN FROM MILKWEED.

I submit some bees for your inspection. Will you undertake to tell me what that is on their feet, and where or what do they get it from?

Central City, Neb., Aug. 11.

W. H. CAGIL.

[Your bees have on their legs the pollen of milkweed. See the subject of "Pollen," in the A B C book.]

"FATTENING UP" QUEENS.

The queens came to hand all right. They seem to be a very diminutive kind of bee, but perhaps after they get over their trip and fatten up they will be all right.

G. W. LECHLER.

Newhall, Cal., Sept. 1, 1889.

[Look here, friend L. I guess you would need fattening up a little if you had to go through the mail-bags all the way from here to California. The trip would surely make you a little thinner than when I last saw you; but I do not know who would not fatten up if they had such a pretty ranch as yours to keep bees in.]

CLOSED-END FRAMES, SPREAD $1\frac{1}{2}$ INSTEAD OF $1\frac{1}{4}$ INCHES.

I have been reading an article from the pen of H. L. Jeffrey, with a great deal of interest. He writes very positively on the width of the brood-frame, which, he claims, should be $1\frac{1}{4}$ inches in width. I have used this width of end since 1886, and like it the best of any width that I have used.

Danbury, Ct., Sept. 1, 1889.

H. H. KNAPP.

WHAT IS IT WORTH TO EXTRACT A MAN'S HONEY? HONEY-KNIFE HANDLE LOOSE; HOW TO FASTEN.

What would it be worth to extract a man's honey from about 20 hives, using my extractor and all my tools, and with his help? How can I fasten the handle to my Novice honey-knife? It came off while cutting some wax from the top of some frames.

Akron, O., Aug. 12.

CHAS. W. FRANK.

[It would be impossible to answer your question directly. The best way is to hire a man at so much an hour. A man at \$1.50 ought to be able to extract the honey in half a day, provided he has had some experience with bees. A better way, however, would be to use the extractor yourself.—If the handle to your honey-knife is loose, heat the blade shank, dip it into sulphur, and then drive it home into the handle.]

REPORTS DISCOURAGING.

THE HONEY CROP A FAILURE IN CALIFORNIA.

The honey crop on the Pacific coast is very light this year in this locality. Bees are doing very well, working mostly on alfalfa and sunflower. I have about 200 stands, some of which have done almost nothing, while others have done well. One colony has put up 203 pounds of comb honey for the season, up to date.

J. G. GILSTRAP.

Lemoore, Cal., Sept. 3, 1889.

SEASON POOR.

The season here has been a very poor one for honey—very wet and cool weather during June and July. We are now having quite a yield from buckwheat, and may get our unfinished sections filled with that and goldenrod. Queens in nuclei stopped laying for about ten days the early part of August, but are now laying finely again. I never sold (retailed) so much honey before in August. Cause, high sugar and scarcity of small fruits.

Albion, N. Y., Aug. 26, 1889.

G. H. ASHBY.

You make a good point in your concluding sentence. The high price of sugar is doing very much to give the bee-keepers a better price for their products. Truly, it is an ill wind that blows nobody good.

A REPORT FROM ARIZONA.

Up to present time the present season has been a rather poor one for honey. Bees are generally at work in February; but this season, on account of cool nights our bees did but very little until the middle of June; and owing to the water for irrigation failing, it soon became very dry. Our bees have done but very little since July 15. We have taken only 420 gallons from 85 colonies; but as the season is very long here, and we sometimes extract as late as the latter part of November, we can not tell how things will be by that time. We sell our honey at home for \$1.00 per gallon, or \$4.00 for a five-gallon can.

ANNIE M. SKINNER.

Mesa City, Maricopa Co., A. T., Aug. 22, 1889.

Why, it seems to me, my good friend, that if your honey is nice you have got the price very low; if it is as thick as we usually offer it, it would be only 8 cts. a pound at retail. So the amount of honey in your arid region does depend largely upon irrigation.

A DISCOURAGED SISTER.

Two years ago last spring I bought a hive of bees, and thought it would be just fun to watch them "work for nothing and board themselves." I sent away for supplies and literature, and studied bee culture all of that summer. They did very well, and in the fall I had three hives, with plenty of honey for them all winter. I put them into winter quarters in the most approved manner, as I supposed, but in the spring they were all dead, with plenty of honey in each hive. I was so discouraged at the loss of my pets that I have not tried again.

MRS. H. A. D. WESTOVER.

David City, Neb., Aug. 24, 1889.

Why, my good friend, you have no reason at all to be discouraged. Was not the honey you had left worth nearly what the experiment cost you—especially if you in your figures estimate the "fun" for what it was worth? Very likely, in Nebraska you will need to winter in the cellar. Get some

more bees, and fill your empty hives, and you can surely master the matter of wintering, by the help of the ample directions given by our able writers.

REPORTS ENCOURAGING.

Bees are going for the buckwheat, with a grand rush. It has started the swarming fever.

Tidal, Pa., Aug. 23, 1889.

S. HEATH.

My honey crop is about 22,000 lbs. comb, and 3000 lbs. extracted, from 185 colonies, spring count; increased to 275.

C. THEILMANN.

Theilmanton, Minn., Sept. 16, 1889.

FROM 3 TO 13, AND 150 LBS. OF HONEY.

I commenced the season with 3 hives of bees. I transferred and increased to 13 colonies. The bee-keepers in this section of the country will remember this one for the large rainstorms we have had. I shall have about 150 pounds of surplus honey, leaving my bees with good supply to winter on.

Arden, N. Y., Sept. 18, 1889.

J. G. EARL.

BEEES DOING SPLENDID.

Bees are doing splendid in this part of Canada. They are working on buckwheat. As I saw that they were very busy to-day I started toward the hives to see what they were working on, and I did not have to open the hive, for I could smell it at quite a distance. There is quite a number who have a few colonies, and I let these have GLEANINGS to read, and they get a good lot of information out of it, so I think next year they will take it for themselves.

THOS. J. SMITH.

Aylmer, Ont., Can., Aug. 14, 1889.

BEEES HAVE DONE WELL.

Bees in this immediate vicinity have done quite well, notwithstanding the wet season; but it may be owing to there not being any large apiaries. I understand they have not done as well in Addison Co., where the large apiaries are. I have ripened some of the *Ignotum* tomatoes from the seeds you gave me, and they are smooth and nice—not quite so early, seemingly, as the Mikado, but a better habit of growth—not so sprawling.

A. A. LEWIS.

Waterbury, Vt., Aug. 19, 1889.

FROM 60 TO 130, AND 4000 LBS. OF HONEY.

I commenced the season with 60 colonies, mostly in good condition. I lost only two through the winter. I divided about half by artificial swarming, while they were working on dandelion, which did not furnish as much honey as in some years. Clover was a little late in coming on. I do not think my apiary would have averaged 5 lbs. of honey per colony when the clover commenced yielding honey. I had to feed some colonies to prevent starvation; but when they did commence gathering honey it came in with a rush. The combs being empty, the queen filled every thing with brood, which caused an abundance of swarming. I never had such a time with swarming. I was not expecting it, and not prepared, so I had to do the best I could. Every thing swarmed until I increased to 130, and had some 20 that left for parts unknown. I have taken from several new swarms, after filling the hive, 75 sections of comb honey up to date. I have taken, altogether, 4000 lbs.—1000 comb, and 3000 extracted.

New Sharon, Ia., Sept. 3, 1889.

GEO. BRIGGS.

NOTES OF TRAVEL.

THE SHOT-TOWER HIVES, ETC.

As we could not get our engravings ready in time to go with my notes of the different apiaries, we shall have to go back a little. Below is a picture of one of friend France's apiaries.

A GLIMPSE OF ONE OF E. FRANCE'S OUT-APIARIES.

You will notice that the Kodak has a kind of way of tipping objects out of shape unless they are right in the center of the focus; therefore the shot-tower hive in the above, on the left hand, seems to be leaning dangerously. In the center of the picture, underneath a beautiful tree, you will notice the framework of one of the extracting tents. The frame is left permanently in each apiary, while the cloth is unhooked and folded up and carried from one apiary to another. A light door is also moved along with the cloth. With plenty of help it is but a few minutes' work putting up the tent and getting ready for extracting. The hives in the picture are all or nearly all of the "shot-tower" "persuasion," therefore each hive should count four. At first glimpse you would say that friend France's out-apiaries are small affairs—may be only fifteen or twenty hives being visible; but when you discover that each hive contains four rousing colonies, it is not such a small affair after all. Several questions have been asked in regard to these shot-tower hives—the size of the frame, etc. The frame friend France prefers is shown on page 776 of this issue. The dimensions are something like 12x21, if I make no mistake. Of course, there is to be a cross-bar in the middle, to separate so large a comb. Now, when these

large frames are used two stories high, and in a tenement hive containing four colonies each, no wonder the boys call it a "shot-tower." Three such hives make a pretty good load for a two-horse wagon; but they really comprise twelve hives. The cut at the bottom shows one of the hives taken separately.

One of the first questions to be asked is, "How do you get at the frames of such a tall hive?" Well, friend France is not only an advocate of a tenement hive, but he advocates side-opening hives; therefore every one of the four sides of this tall hive swings open, so you can remove the combs from the lower story if you choose, without disturbing the combs in the upper one at all. A good many years ago it occurred to me that a side-opening hive could be made strong and substantial by having two or more hives built together. In the same way we can have a side-opening hive in a house-apiary; that is, a hive may be made in this way strong and substantial, and yet permit one entire side to be taken out in order to remove the frames from the side instead of lifting them over the top. Furthermore, friend France is a firm believer in chaff packing. Bottom, top, and sides, and every part of the hive where it is exposed to the weather, is protected by substantial chaff packing, chaff division-boards, or chaff cushions, whichever you have a mind to call it, or perhaps

a combination of all three together. I do not wonder that such hives winter bees, even in Wisconsin, without any loss at all; for four strong colonies, placed together so as to form collectively pretty nearly a cube of bees, with such protection as they have all around them, are ever so much better protected than we can very well fix a single

FRANCE'S SHOT-TOWER HIVE.

isolated colony. Friend France is so much opposed to dampness that his hives are all upon stakes. The northwest wind can sweep right through under every hive; but it has got to get up through good chaff packing, and, if I remember correctly, tarred paper besides, before it can chill the toes of even the lowermost layer of bees in these big structures. I think the top is hinged, so it turns over and rests on a stake, but I may be mistaken. Now, if you still have more questions to ask, we will submit them to friend France himself; and if I have made any mistakes he can set me right.

Let us now skip over the hills to the beautiful town of Orion, on the banks of the Wisconsin River. The town is not very much, it is true; but its location haunts my memory still as one of the prettiest spots on the face of old Mother Earth. I can give you only one brief glimpse, taken from friend Snyder's pretty home. He has cop-

ied your old friend so far that there is a stairway at the back side of his honey-house, and a little platform up near the roof, where the children climb around and play. It was up on this platform where we stood that foggy morning, hoping the sky would just lighten up a little bit. Well, it did enough so we decided to try it, and the Kodak was snapped several times toward the hives, Ignatum tomatoes, and the grapevines. The cut shows the result. You can see the tomatoes pretty well; also the grapevines. The

ground was soft, mellow, and clean. I fairly ached to get a sharp-toothed steel rake and rake over the surface; but it did not really need it, for he and his children had fixed it nicely. I hardly think they expected Uncle Amos to come around, for I had just written him that I could not well make him a call. And then those bee-hives! Friend Snyder is a carpenter, and so the hives were made just right, and, as a matter of course, each hive was so like its neighbor that nobody could tell one from the other. Now, to make hives unlike by architecture and carpenter work is expensive; so friend S. decided to paint them unlike, firmly believing that bees distinguish colors just as we do. He has remarkable taste in making these decorations tasty, and at the same time having them unlike. With the dim light we had, the Kodak could hardly catch it; but if you look sharp I think you will see the scallops, festoons, brackets, etc., all

done with the paint-brush. Perhaps his good wife helped him before she left her little home for that home beyond; for some of the embellishments are strikingly in a line with feminine taste and feminine work. May God's blessing rest over that motherless home; and may the father, and children too, always find enjoyment and satisfaction in working together inside of the fence that incloses their own dooryard.

We will now stop at the Agricultural College, on our way home from Manistee. Katie is playing on the pretty lawn in front of Prof. Cook's house. She remembers Uncle Amos, and tells me that her papa is probably in his office, over across the grounds. Although I have been there a good many times, there are so many buildings, and so many offices, that I can't just now decide which is Prof. Cook's. She tells us it is in the building occupied by the museum. Oh, yes! where the bugs, butterflies, etc., are

pinned fast in glass cases. When I got there, one of the students said friend Cook had just started off across the fields; and on looking out of the window we caught a glimpse of a couple of people away in the distance, going rapidly from us. Now, although a cousin of mine, who lives in Lansing, and Blue Eyes, were in the buggy waiting for me to come down, I started across the lots after Prof. Cook. I did call to them to go over to the greenhouses and gardens, and see the nice things, if I did not get back as soon as

A GLIMPSE OF FRIEND SNYDER'S APIARY, ON THE BANKS OF THE WISCONSIN.

they expected. Where do you think I found friend Cook? Why, he was right in the middle of a field of several acres of Rocky Mountain bee-plant. He was out with one of his students who had charge of this department. They were so much interested in the sights that old Dame Nature had to show that I was right close behind them before they saw me approaching. Of course, there were a dozen things to look at and talk about all at once. The Rocky Mountain bee-plant had not made a good stand. It had come up just about as I told Prof. Cook it would when he told us of his project at the convention in Columbus, about a year ago. We have always had trouble in getting the Rocky Mountain bee-plant and the spider-plant to germinate. The only way of getting a good stand for a whole field is to raise the plants and then set them out as you would tomatoes. In this way we can have the ground covered with bloom, every

foot of it. But it is pretty expensive work for honey alone. One of the students was with Prof. Cook; and while we were talking he called our attention to a plant that

who had charge of the apiary, informed us that the honey was coming in at a pretty fair rate, supposed to be from the Chapman honey-plant. As, however, the bees had only just ceased working on basswood, and at the same time were pretty busy on the scattering plants of the Rocky Mountain plant, it was hard to decide positively where the honey came from. Prof. Cook will doubtless himself tell us whether he would advise planting and cultivating either of the plants for honey alone.

When we got back to the wagon, where the women were, of course I got a scolding. Friend Cook pleasantly suggested, however, that they need not have been troubled, especially while there were so many things to be seen. They replied that they had seen all they wanted to, while no one they knew was around to show them, or answer their questions.

"Did you see our beautiful collection of butterflies and moths?" said friend Cook.

"Yes," replied they, "we have seen them all."

By a little inquiry he decided that they had not seen the butterflies; and he signified to me that he had a rare treat in store for all of us.

Of course, we went around to the house, and met Mrs. Cook, and Bertie and Katie, and finally we went for the butterflies. I had seen butterflies at the Agricultural College before, and did not expect to see any thing particularly wonderful, only I noticed, by the twinkle in my friend's eye, that there must be something of unusual

GLIMPSE OF A FIELD OF CHAPMAN HONEY-PLANT ON THE COLLEGE GROUNDS AT LANSING.

bore pure white blossoms, instead of pink, like the rest. Friend Cook put his hand on the student's shoulder, and commended him for his habits of observation. It was probably a sport; but if anybody should want a white Rocky Mountain bee-plant, it can readily be furnished. Mr. Samuel Wilson, of Mechanicsburg, Pa., who has advertised the seed of the Rocky Mountain bee-plant so extravagantly, had better come and see how it has succeeded on the grounds of the Michigan Agricultural College. Booming new things away beyond their merits is beginning to bear its fruit; and the seedsman who continues to do it will suffer, sooner or later, in the estimation of the public. I told friend Cook the women were probably anxiously waiting for me where I left them; but there were so many things to talk about on our way back, especially since I told him that I must leave by the morning train, that it took me a good while. The Chapman honey-plant has done much better. It was, however, cultivated like garden crops, for the first season, and now it is a thing of beauty. By the aid of the Kodak I am enabled to give you the view above, which was taken from a little distance, so as to get a glimpse of the whole field, plainly showing the rows. The adjoining view gives another glimpse, where the Kodak was held within a few feet of one of the plants.

The two views above give a very fair idea of the looks of the field. The bees from the apiary, only a few rods away, were very busy on the plants. Prof. Cook's nephew,

THE CHAPMAN HONEY-PLANT, OR GLOBE THISTLE, NEARER BY.

interest. We went into a room adjoining the museum, and stopped before a case of shallow drawers that reached from the floor to the ceiling. As friend Cook selected

special drawers, and exhibited them to our gaze, we raised our hands and opened our mouths. We soon discovered, however, that the gorgeous changes he had in store for us were almost as varied as the forms of the kaleidoscope; and when we had almost exhausted our expressions of wonder and admiration, he informed us that we had not seen the *butterflies* at all. What we had been looking at were simply *moths*. I guessed that these must have come from some other country—possibly from the tropics. He assented, but exhibited some, almost as pretty, that came from our own climate. Many of these, he said, were nocturnal moths, or those that fly only in the nighttime, and which had been found under the electric lights.

I am informed that sometimes as many as a peck measure full of moths may be scraped up on the ground under these lights. Of course, it affords a wonderful opportunity for making collections of the night-fliers. It has been suggested that this may be the means of diminishing the codlin moth and the cabbage butterfly; but, if I am correct, these are not night-fliers; and those who have burned lamps, set in tubs of water, to catch moths, succeeded in capturing only those which are not injurious to our crops. Will Prof. Cook tell me if I am correct? Some of the most gorgeously painted insects were from the tropical climates. The collections now of moths and butterflies embrace specimens from almost every part of the earth. In a very little time we began to find our stock of exclamations running short, when Prof. Cook, in one of his happiest veins, said, "Now, look here, friends. I am not near through yet;" and he pointed to an appalling array of drawers yet to be opened. "Please save some of your very best expressions of wonder until we get over to that next case."

We soon found his words were true; and then he explained briefly the way in which the moths were classified. Certain peculiar colors, or shape of the wings, enables the entomologist to place them in families. For instance, there were several drawers of swallow-tailed butterflies; and we recognized a few of them as seen around our own homes. The wonderful facts connected with these insects sound something like some of the stories in the Arabian Nights, and only proves again that truth is more wonderful than fiction, and that the machinery of the universe is more strange than any thing yet gotten up by mankind. Most wonderful of all, God has endowed us with faculties that enable us to traverse understandingly these wonderful labyrinths of science and nature. If you ever go to the Agricultural College of Michigan, ask to see the new butterflies. Very likely the collections of our other experimental stations are much like those at Lansing, but I hardly believe that any other State has as yet caught up with Michigan in this particular line. Quite a number of our bee-friends, I happen to know, are interested in such collections; and I now call to mind H. R. Boardman and E. France. If these two could get together and get acquainted, what a time in visiting they

would have! And right here, friends, lies one of the grand features of our large conventions. Before leaving the butterflies I snapped the Kodak on several cases of collections; but, probably owing to my inexperience, they were hardly worth using for print. We were both up at daylight, and I was so anxious to see their test grounds for garden vegetables that Prof. Cook took the liberty of waking up some of the students who had charge of this department. Their experimental grounds are beautiful, and in splendid order; yet, owing to their colder climate, many things were behind in season compared with ours here at the Home of the Honey-bees. For instance, there was not a tomato ripe on their grounds, while we had been selling them considerably; and in regard to bush lima beans, they had not a plant, either of Henderson's or the Kumerle. That cold spell the first of June, at the time when it killed more than half of ours, seems to have killed every one on the college grounds. All that remained were the neatly painted stakes, telling where the bush limas had been planted, and when.

MYSELF AND MY NEIGHBORS.

THE MACHINERY OF THE UNIVERSE.

The heavens declare the glory of God, and the firmament sheweth his handiwork.—PSALM 19: 1.

I PRESUME that most of you are somewhat like me, inasmuch as you like to "have things happen." At times you greatly feel the need of something to enlist your sympathies and to stir you up. When we were children we used to like excitement of some kind or other—Fourth of July, Christmas, circus day, and some of us probably enjoyed a thunder-storm—yes, even a hailstorm that broke the windows; possibly a flood, if it were not on too large a scale. The coldest day that was ever heard of furnishes matter for conversation, likewise the hottest day that even the "oldest inhabitant" has "never seen the like on't" before. Well, even now I sometimes get tired, or weary, rather, with the cares of the office. I hardly can say the *monotony* of the office; for although we may be overworn by the amount of work, as well as by overwork physically, we ought not to quarrel with our bread and butter, or, in other words, we should be content to take up the work that lies straight before us, even if we do not feel just like it. Well, these thoughts were prompted by thinking that perhaps I could help you to enjoy life, and may be to love God more, by watching more intently the machinery of the great universe. A friend of mine who lives in the city of New York told me that he greatly enjoyed seeing the workmen make progress day by day on the great Brooklyn suspension bridge. As he passed it twice every day, in going to and from his work night and morning, he had ample opportunity, especially as they were thirteen years in building it. Now, perhaps you may say, "Oh, yes! who would not have

enjoyed such a sight as that? But no such work as that is going on right in sight of where I live." My friend, do not be too sure. There is a wonderful work going on right in sight of your homes, and right before the eyes of almost every one of you. In fact, I have become, especially of late, much in the habit of employing my leisure moments in studying the machinery of the universe; and I have enjoyed it so much is what prompted me to take up the subject.

In studying the machinery of the universe, I find that I can, to a certain extent, make my work and my plans harmonize with God's work and plans. It is true, I am only a speck of this great universe—a very small cog-wheel, you may say; but for all that, I am a piece, and so are you, my friends, and there is a work for you to do.

The machinery of the universe is ever changing. You may not have noticed it, but there is something going on and something new under way every minute of your life. There are currents of wind, away up high over your head, that you know nothing about. Important changes are going on up there, even when the sky is clear during a summer day, and at the same time there are things moving in the earth away down under your feet—things that you do not suspect or dream of, and things that human beings like you and me have only recently learned to let out. I have told you how much I love springs of water, and how delighted I have been when able to bid them come forth, where I did not even dream it was possible. When I was up at Green Bay, Mr. Smith, the great gardener, showed me an artesian well right near the lake shore, where water rose in a pipe 80 or 90 feet high, and they used it for the waterworks of the city; and as they still have a surplus he has made arrangements to have this surplus for his gardens. Now, there is not any ground within miles and miles that is 80 feet higher than the level of the lake. Then where does the water come from? Nobody knows. Where most of you live, gas is found to a greater or lesser extent. Yes, gas is to-day bubbling out of the fissure in the rock where I found my latest and prettiest spring. It will not burn, though, so I suspect it is carbonic acid. But where does it come from, and what makes it keep coming? May be some of you can tell me. Our wind-mill is an object of unlagging interest to me, because it indicates at a glance the *direction* of the wind, and pretty nearly the *force* with which it blows. I often watch it before storms, to see how quick it changes about from north to south, or from east to west, just as some of us change from good to bad, from industry to idleness, or the reverse; we hope; however, more often the latter. Now, during our recent drouths it has been very interesting to me to watch the clouds. Do you know the clouds never stand still? More than that, they are constantly changing their shape, changing their size, and appearing where, but a minute before, there was no cloud at all, and again disappearing in just a few minutes. Take a book and sit outdoors. I do not think it would be wicked if you

should do this on Sunday afternoon, providing you have a good book suitable for God's holy day. Now, while you read, every now and then watch the sky and the clouds. A barometer and thermometer are almost constant companions of mine, and very pleasant companions, for they tell me what God's forces are doing. Both of them are almost constantly changing more or less. By watching these changes they will help you very materially in your work. Sometimes a knowledge of what is going to happen will save you many dollars. I have told you about this before. You know I mentioned advising the hands making fast the doors and windows to see that nothing was where it would blow down and do damage (even before we had a breath of wind), just before we had our little hurricane on the 9th of last January. In a few hours there was a great loss of property, and in some places loss of life, from the tornado.

I have always been more or less interested in well-drilling. Well-drilling is now a great industry. Not only do they get oil, gas, and water from wells, but they get salt, alum, and many other chemicals, especially from the deep artesian wells.

About two weeks ago I noticed one evening that a very bright star, or planet, rather, was pretty close to the moon. An hour later I got so sleepy reading my agricultural papers that I felt as if I could hardly hold my head up a minute longer. On looking out, however, I discovered the bright star very much nearer to the moon, indicating that it was rapidly approaching it, or, in other words, the star was "chasing" the moon. I at once decided (and I was wide awake all of a sudden too, I tell you) that I would sit up and wait for the event, remembering that, almost 40 years before, I saw a similar phenomenon. I began to think that Ernest would be delighted to see it, for he is, like myself, an enthusiastic admirer of the machinery of the universe. And just then I heard his voice in conversation, for his house is just across the street. I asked him if he had seen that star approaching the moon. He said they had been watching it for some time. Mrs. Root could not afford to sit out on the sidewalk with us to watch it, but she said that, when the crisis came—that is, when the star began to go behind the moon. I might call her. Well, I did call; but before she got out of the house the bright star had gone. In its approach it passed under the dark side of the moon, therefore all we could see was that the star became dimmer and dimmer, and finally was invisible. I calculated that, at the rate the star had been apparently chasing the moon, it would be perhaps an hour before it came out on the opposite side. Very likely many of my readers who are versed in astronomy will criticise my description; but I am talking only to common people like myself. To us it seemed as if there was a race between the star and the moon, and that the star was rapidly gaining. I went into the house and got Blue Eyes' light willow rocking-chair, the opera-glass, and my overcoat; and then I sat on the sidewalk and waited for

the star to come out on the bright side. Our proof-reader, who watched it with his telescope, says it took between 68 and 71 minutes; but so much interested was I in studying the machinery of the universe that I did not feel sleepy one particle; in fact, I enjoyed every one of those 71 minutes in looking at the beautiful bright moon through the opera-glass, and thinking it was more than a hundred times as far away as the furthestmost point I reached while in California. The immense distance seemed to be easier to realize than ever before; and the very thought of the vast expanse filled my soul with wonder and reverence for the great Father who rules over all. Our proof-reader suggests that, when one considers how much further off Jupiter is than the moon, one might consider the moon as almost in the next dooryard; for although it is a quarter of a million of miles to the moon, it is 332 millions of miles to Jupiter when the earth and Jupiter are both on the same side of the sun; from which we see that Jupiter was probably 1328 times further than the moon on this night. It was agreed that I should signal the neighborhood when the star came out. It was not visible for some time to the naked eye; but through the opera-glass I caught the first glimpse of the planet as it began to emerge. It looked something like the half of a pea stuck on the side of a great pumpkin. It moved so slowly, however, for some time that I thought it was my imagination instead of the real planet. And just then I enjoyed through the opera-glass seeing Jupiter as a little round ball, or a little globe of fire, if you please, perhaps not much larger than one of the periods on this printed page. Although it seemed so small compared with the moon, it is in reality as large as 66,150 moons all jumbled together in a heap. While it was near to the bright moon, the globular shape was very clear and distinct; but when it got off on its pathway away from the moon, strange to say my glass did not show the globular form at all. It was only a bright, blazing, twinkling star. Now, ever since that night I enjoy looking at the moon and Jupiter as I never did before. At this date, Sept. 18, Jupiter is away off on one side of the heavens, while the moon is clear on the other side. They have thus traveled thus far apart in a little over two weeks, although they are both going in apparently the same direction.

If you get up in the morning before daylight, or before there is any glimpse of sunrise in the east, you will see another star of wondrous beauty. It is brighter, and makes more of a blaze, than does Jupiter, for it is at least ten times nearer to us. This is Venus, the twin sister of our own beautiful planet. Now, one who has never become acquainted with the stars, nor studied their wonderful movements, has, as it seems to me, lost one great part of the enjoyment of life. Well, the things I have mentioned are about the hundredth part of the glimpse we may get of the workings of the machinery of the universe, if we use our eyes and ears and intellects that God has given us. In the *Orange Judd Farmer* of a recent date,

our old friend O. Judd tells us by the statistics that the oil product is rapidly decreasing, and suggests that it will probably fail entirely in a few years. He says, however, that we need not feel bad about it, or even troubled, even if our coal-oil lamps are soon to be relegated to the garrets or corncribs as useless truck. Electricity is coming fast on the heels of kerosene. Yes, it is chasing it up just as that star chased the moon, and went ahead. Our county fairs, conventions, and expositions, while they give glimpses of the machinery that man is building, at the same time give us also wonderful glimpses of some of the machinery of the universe.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

TRANSPLANTING-TUBES.

IT is my impression that the value of these has not been fully realized. In taking the place of potted plants for strawberries alone, am I sure there is a wonderful saving in time. To get potted plants you are obliged to provide yourself with pots; then they must be planted, and a runner put in place; and unless it rains, at least a great part of your pots will be failures. When they are fully rooted they must be examined again, and taken up when they are just right. My experience is, more or less of the pots will be overlooked and lost until the hoe or cultivator strikes them at some future time, especially if you employ somebody else to do the work. Now, with transplanting-tubes you simply do nothing until you want to use your plants. Then go over the ground and take out such ones as please you. Set the tube over it, press it down until it is just deep enough to lift the plant—dirt, roots, and all. I mention this because one friend pushed the tubes down level with the ground, and, as a consequence, he had no cup above the plant to contain the water, and he could not get the plants out. Now you can put your plants where you want them, at once, and they will not stop growing, nor heave out by frost in the winter, any more than if they had not been moved at all. The job can be finished at one time, and there is nothing more to be done. The patch set out during our recent drouth have every one lived. There had been no rain for two weeks when we put them out, and there was none for nearly two weeks afterward. Some of the tops died down, and I told my wife that I guessed that half of them were dead. After a rain I asked her to find a single plant in the whole 3000 that was dead. She finally found just one; but I stepped over and pushed the dirt away, and showed her a bunch of green leaves that had not yet got above ground. Plants can be moved where you wish, whether it rains or not, and you need not lose one in a thousand. Furthermore, you may have a splendid crop of fruit the very next season. About the finest show of strawberries I ever saw was where I put out 3000 plants last year, after digging

our early potatoes. The following extract from the *Rural New-Yorker* shows that friend H. A. March has already used the device for raising American-grown cauliflower seed :

RAISING CAULIFLOWER SEED IN PUGET SOUND.

To get the plants we sow the seeds about September 1, in a rather poor soil, giving them plenty of room, the rows being a foot apart and the seeds sown thinly in the rows. This gives us stocky and hardy plants, which, we think, are less liable to damp off when transplanted. About November 1 we transplant the plants into cold-frames six inches apart each way, as we wish to keep them growing a little all winter. The glasses are kept on at night and through heavy rains. In case of a cold snap, we cover the glasses with mats; but that is not often necessary, for we seldom have a temperature colder than 16° above. Every thing depends on good plants and an early start in the spring, for we raise two crops the same season, and an early frost on our unripe seed is sure to ruin the crop. Now, to set the plants out and make them grow from the start, a line is stretched along one of these flat ridges; a boy goes along, and with a three-foot marker marks the spots for the plants; a man follows with a hoe and makes a hole, about the size of a quart dish, to receive each plant. During the winter we have gathered up 200 or 300 tomato and oyster cans, melted off the tops and bottoms, leaving tubes about five inches long by three or four across. Now, armed with a light wheelbarrow with a wooden tray containing from 50 to 75 of these cans, we go to the cold-frame (having well soaked it with water the night before); take a can, set it right down over the plant; press the can into the soil about two inches, and, with a light shove to one side, lift the plant without disturbing the roots; fill our tray and start for the field; run the barrow between two rows, and set a can and plant in each of the holes just made. A boy follows with a watering-pot containing warm water, and pours a gill into each tube, which softens the soil so that the tubes can be lifted right out, leaving the plant standing in the hole. We brush a little dirt around the plant and firm it with the blade of the hoe.

Now we have our plants set, and not one ever wilts in the hottest spring day. In two or three days the cultivator is started, and kept a going once a week until the heads begin to form.

THE IGNOTUM TOMATO.

At present our orders are considerably ahead of our supply of seed, though we have the promise of quite a little from the friends who received trial packages. One lady who purchased 200 Ignotum plants of us in June was offered \$17.00 for the seed she saved. It is gratifying to notice what a prominent position the Ignotum is destined to take among tomatoes. We copy the following, from *Garden and Forest*, of New York, for Sept. 4 :

An interesting exhibition of tomatoes was on view at the seed warehouse of J. M. Thorburn & Co., in this city, last week. Eighty varieties were named; and although several of them were plainly duplicates, the diversity of form and color and texture was so marked that some fifty distinct types could be recognized. The smooth outline and solid flesh of some of the newer varieties, like Thorburn's New Jersey, proves what can be accomplished by patient selection; and yet the tomato which, perhaps, showed the most compact and yet the finest texture, was Ignotum, which, as its name implies, is from absolutely unknown parentage.

THE DWARF LIMA BEANS.

We have already harvested several bushels of the Henderson dwarf lima. In quality for table use, it is, so far as we can tell, fully equal in flavor to the pole limas. My wife says if she were blindfolded when eating them she could not tell one from the other. The little bushes are very productive, and they ripen quite early, which is quite a strong argument in their favor. Another

thing, a peck of pods will make more quarts of shelled beans than a peck of pods of our large limas. The reason is, the large limas have so wide a pod according to the size of the bean. It is about as much work to shell the little beans as to shell peas. What shall this new dwarf lima be called? Peter Henderson has given it his name; but it transpires that the bean was well known in several localities, and has been catalogued for years as the Dwarf Sieva, or Carolina bean. It seems to me it would be a great blunder to change its name just because it has been brought prominently before the public. It may be that Peter Henderson did not know it was already catalogued and had an established name. But if he did not know it, he certainly knows it now. Landreth has had it in his catalogue some time, and I have also found it in other catalogues.

THE KUMERLE LIMA BEAN.

This seems destined to prove a wonderful acquisition. Its only fault is the length of time it takes in ripening. Ours are now just right to cook, but we expect frost daily. The beans are monsters. They are not only large around, but fat, or thick through, and one of them makes a bigger mouthful than any other lima bean I ever saw or heard of. They are also wonderfully productive. One of our plants started to run up on a pole, and has branched out until there are at least a hundred pods of immense lima beans. I can not very well count them now, because the whole plant is such a swamp of foliage. They need considerable room, but they will surely give a tremendous crop. We hardly dare take enough of them to cook for a taste. Probably the new crop will not be worth its weight in gold, but very likely the beans will command their weight in silver. Until somebody informs me of a supply of them I shall take the liberty of putting that value on them.

I promised to have a photograph of the plant; but it has such a dense pile of foliage there will not be much to see. The pods are all concealed by the great leaves. Somebody wrote to me that the pods must be supported on brush or sticks, or they would rot during very wet weather. Very likely this is true; and although such a support might not be as expensive as poles, it may be well to consider it.

THE OREGON EVERBEARING STRAWBERRY.

At this date, Sept. 27, we have received three different lots, of one dozen each, by mail. On the first ones, on account of the great distance, the moss was apparently as dry as it ever would be, and the plants were in the same predicament. It did not seem to me that there was a chance for them to grow. However, I concluded to give them a chance. They were put in the rich soil of our plant-beds, watered, and shaded, and, strange to say, in a week one of them sent out a little green leaf; and in a day or two after, another one did likewise. Now, please, friends, do not be in a hurry to say that plants are dead, especially if they are a valuable variety. It will doubtless take sometime for them to make strong plants; but with strawberries sent a long distance,

I think it a very good thing to put them in rich soil, where you can shade and water them for a week or two until they send out new roots; then take them, dirt and all, to the field, and you can make a pretty sure thing of it. Friend Winquist writes as follows in regard to the new strawberry:

Friend Root:—I am literally flooded with orders, and have only a limited number of plants left to sell, as I intend setting out two or three acres this winter, because they bring me more net cash than all other berries, fruit, etc., combined. I had no idea that my little notice would bring so many orders.

For runners and large plants, plant on rich land; if for berries all summer, plant on your poorest land. We now get 40 cents per box, wholesale, for our berries, and can not supply the demand at that price. We got as low as 2½ cts. per lb. or box for nice Wilsons this spring, and paid 1¼ cts. for picking; had to go begging at 2½. They do not produce nearly as many runners as do the common varieties, neither do they bear as many years, although they bear as many, if not more, crops in their life. The berry was originated here at Mount Tabor by Mr. N. Remillard, who sold his first plants as high as twenty dollars a dozen. He has no plants for sale now, and he says that he refused to sell Vick any. One of his neighbors got some Chinamen to steal plants from him. In regard to the berry, I refer you to Mark Levy, Portland, Ore., also to Levy & Spriegel, Portland, Ore.

Your climate in the States, I think, is better adapted to the plants than this, as you have show-ers during the summer, while here we have but little rain during the summer, or dry season.

SETH WINQUIST.

Mount Tabor, Or., Sept. 20, 1889.

He has now advanced the price to 75 cts. per dozen, or 50 cents per ½ dozen.*

THE HONEY MARKET.

WE clip the following from the *American Grocer*, of New York, of Sept. 25:

The market on this article is firm, consignments few, and higher prices looked for. California crop is about all in, with the exception of a few odd lots

still in the interior. Prices will undoubtedly be too high for the Eastern trade.

Perhaps it may be well to add, that we have never had so good a demand for honey before; but purchasers are very particular about having a good article. There seems to be somewhat of a disposition to wait for better prices on the part of some; but altogether, we think our honey will be taken up at fair prices quicker than it has been any season before for a long time. The false statements of the newspapers seem to have blown over a good deal, and truth is beginning to assert itself; therefore the public are asking for honey with more confidence than they did a few months ago.

DON'T SELL TOO CHEAP.

We had a pleasant call a week ago from Joseph Nysewander, Des Moines, Ia., publisher of the *Western Apiarian*. He said, while here, that very nice comb honey was selling in Iowa, in a wholesale way, at 10 cts., and some even as low as 8½; that nice extracted was selling for 5½ and 6. Now, if you notice the above report of the New York market, and the quotations in the Honey Column, from the East, and remember that the freight from Chicago to New York, Boston, or Philadelphia on comb honey is 75 cts. per 100 lbs. on extracted in cans boxed, or kegs 65 cts. per 100, and in barrels 50 cts. per 100, you can easily see that there is an opening in the East for some of the surplus west of Chicago, without selling at such low prices. Remember, however, that there is considerable risk in shipping comb honey so far in small lots, especially when not well packed and properly loaded on cars.

HOW I RAISED 100 BUSHELS OF POTATOES FROM A QUARTER OF AN ACRE.

ABOUT a year ago I purchased 50 bushels of Lee's Favorite potatoes for seed, paying 50 cents a bushel for them. They wintered splendidly; but in the spring I found myself unable to get even what I paid for them. Finally, along in May I began selling them for 10 cents a bushel, to get them out of the way. Many of them had sprouts on them six inches long. When it was pretty evident that no one wanted to buy any more for seed, I took about 20 bushels of the largest and finest ones, and planted them on a quarter of an acre of our rich market-garden ground. You know I have been telling you that, if you want earlier potatoes than anybody else, plant whole ones, and the biggest ones you can get. Well, these potatoes covered the ground sooner than any I ever saw before; and in just a little while the ground began to heave and crack open with the great beauties underneath. They had plenty of rain, and therefore went right along from planting to maturity. They were dug, and placed in the cellar at a cost of only 3 cents a bushel. We used a cheap potato-digger that cost us only \$12.00. Do you ask what the matter is with a cheap potato-digger that will give such a result as this? Only one trouble, my friend: In plowing the ground and fitting it for cabbages afterward, the boys took up at different times nearly ten bushels that the digger missed. It cost a good deal more than 3 cents a bushel to get out those last ten bushels.

Moral.—Whenever potatoes are very low in the spring, it will pay you to plant perhaps even one hundred bushels to the acre, for seed; for large potatoes are worth a good deal for manure whenever they can not be used for any thing else.

*Please take these prices instead of those in his advertisement on next page. Some complaints have been received because friend W. returns the money instead of filling the order; but I believe it is always considered honorable in such matters to return the money when the demand is beyond the supply.

DISCOUNTS FOR ORDERS RECEIVED BEFORE NOV. 1.

Remember, there is less than two weeks' time to get in orders so as to get the best rates mentioned on the first page of the cover.

FULLER'S STRAWBERRY CULTURIST.

The little book we have been so long selling for 15c is now revised, enlarged, and put in stiff covers. The usual retail price is 25c. Our price is 20c; and if wanted by mail, 3 c more for postage. The revision was made in 1887. Please take the above price instead of 15c, as it appears on the cover of this issue.

AN APPENDIX TO DOOLITTLE'S BOOK ON QUEEN-REARING.

An appendix to "Scientific Queen-Rearing," by G. M. Doolittle, is given in the Second Edition, which details his further experiments in his methods of queen-rearing.

This appendix will be mailed free of cost to all who have the first edition, upon application at this office. It is now ready for delivery. The second edition of this interesting book will be mailed to any address, postpaid, for \$1.00.

JERSEY WAKEFIELD CABBAGE SEED.

We have just purchased from H. A. March his entire season's crop of stock seed of the Extra Early Jersey Wakefield cabbage. It is my impression that there is no better strain of this cabbage seed to be had in the world. Notwithstanding this is stock seed, so long as our supply lasts our price will be as heretofore: Packet, 5c; oz., 20c; lb., \$2 50. If wanted by mail, add the usual 9c extra for postage and packing. As our supply is limited, it may pay you to order what you shall need for the next season, at once. Our friends in the South will need to plant it now—that is, wherever cabbages winter in the open air. See below what friend March says in regard to the seed furnished us:

FRIEND ROOT.—We have saved the stock seed for you, and it is No. 1—the choice heads of over two acres of seed. D. M. Ferry & Co. gave my cabbage and cauliflower seed a good trial, and have bought over \$3000 worth of me. One of the firm took the trouble to come out to Puget Sound on purpose to see our seed-farm and our manner of growing seed. He was so well pleased that he ordered every pound we had. H. A. MARCH.

Fidalgo, Wash. Ter., Sept. 7.

Bee-Keepers & Supply-Dealers, Please Take Notice.

We will allow a heavy discount this fall and winter on all orders received for supplies. Estimates gladly furnished, and correspondence solicited.

Our new price list will be ready about Dec. 1st. Send for it. 20tf

KIND WORDS FROM OUR CUSTOMERS.

I received my bees all right. I am well pleased with them.
WESTON CARROLL.
Union, Me., Aug. 30, 1889.

Smokers and A B C received. Both are all you claimed for them.
A. L. REDDEN.
New Orleans, La., July 8, 1889.

Bees were received in splendid condition, and are doing well. Accept my thanks for promptness.
ALBERT WHITNEY.
Birmingham, Mo., June 22, 1889.

I received the Dovetailed hive and sections all right. They give perfect satisfaction.
MRS. J. F. CONNER.
Sand Beach, Mich., Oct. 1, 1889.

Here is another: Please leave out that ad't in GLEANINGS, for I have had so many orders for queens that I can't fill them all.
F. HOWARD.
Fairfield, Ill., Sept. 8, 1889.

A GOOD WORD FOR SUPPLY-DEALERS.

The smoker is received, and I like it very much. You are as prompt as H. P. Langdon and W. T. Falconer. They both are grand good men to deal with.
Cooperstown, N. Y. E. U. PARSHALL.

The A B C of Bee Culture is just splendid. I have got a good many good hints and lessons from it already, which will save me a good deal of work.
Ravenna, Mich. HERMAN J. KUSIG.

I received the foundation I sent for, June 20, and I am very much surprised at the small amount of time you took to mail it to me, and also at the good quality.
JOHN MEL.
Glenwood, Cal., June 24, 1889.

I received the queens in fine shape, and am well pleased. They are the yellowest I ever saw. I introduced them to a large colony of black bees, without trouble.
THOS. E. ELAM.
Mulberry Grove, Ill., Aug. 31, 1889.

The queen-bee arrived safely and satisfactorily. I am well pleased with her and with your directions. I have introduced her successfully. She came to hand on the morning of the 15th.
C. R. MYERS.
Flemington, Pa., Aug. 16, 1889.

I have the pleasure of acknowledging the arrival of goods in fine condition, and according to my order, for which I am pleased to inclose you a balance of — due you on above order, with thanks. Your method of packing goods is grand.
Litchfield, Ill., Aug. 11, 1889. R. S. JOSEPH.

My husband bought a swarm of bees in the spring, and we were advised to get your A B C book. We did so, and that book is the most interesting one I ever read. I study it all the time.
MRS. I. S. NEWCOMB.
Sioux Rapids, Ia., Sept. 14, 1889.

I received the nucleus I ordered of you, June 13. The bees were in fine condition. The queen is beginning to lay nicely. I notice from your card, that you shipped the bees the day you received my order. Thanks for your promptness.
J. M. THOMPSON.
Sherrodsville, O., June 17, 1889.

I received the queen you sent, all O. K. Many thanks for prompt delivery. M. FREISMUTH.
Wheeling, W. Va., Aug. 5, 1889.

SENDING QUEENS TO CALIFORNIA.

The select tested honey queen came to hand to-day in good condition; only one dead bee in the cage. J. F. MCINTYRE.
Fillmore, Cal., Sept. 11, 1889.

LAYING, THE THIRD DAY AFTER ARRIVAL.

The queen mailed me Sept. 6 arrived in good order. It was introduced according to instructions, and commenced laying the third day. B. YOUNG.
Girard, Pa., Sept. 16, 1889.

I just received a sample copy of GLEANINGS. It is much improved since I last saw it. I enjoyed the sermon, also the sketch of "Huber," and many of the shorter articles. MRS. H. A. D. WESTOVER.
David City, Neb., Aug. 24, 1889.

SENDING STRAWBERRY-PLANTS TO MISSISSIPPI.

The plants recently ordered from you have been received in beautiful condition, and, like every thing else you do, the fulfillment is better than your promise. C. P. COFFIN.
Pontotoc, Miss., Sept. 30, 1889.

SENDING STRAWBERRY-PLANTS CLEAR TO OREGON.

The strawberry-plants came to-day in prime condition. Many thanks for your promptness. Bees are working now on white clover. It has bloomed since the rains. E. J. LADD.
Portland, Ore., Sept. 20, 1889.

A PLEASED CUSTOMER.

I thank you for your promptness with my orders for goods I got of you this spring and summer. The 22 one-story chaff hives came to hand all right. Every piece was number one. The queens are doing finely. E. M. BENNETT.
South Charleston, O., Sept. 19, 1889.

DOVETAILED HIVE JUST THE THING LONG LOOKED FOR.

The Dovetailed hives received, and are just what I have been looking for during the past three or four years. I have examined numbers of catalogues. Can I say more? G. F. AYRES.
Atherton, Ind.

Mr. Root:—I must thank you again as I report my success with the little package of Ignatum tomato seed you gave me; they gave us the first ripe tomatoes, growing alongside of other best varieties obtainable, with the same cultivation. I have never seen a tomato, with all the good qualities of the tomato combined, that the Ignatum has. JAS. W. WALKER.
Green Spring, W. Va., Aug. 18, 1889.

A POUND OF BEES AND A QUEEN TO NEWARK, DEL.

The bees, etc., you shipped Sept. 23d were received in Newark, Del., Sept. 26, in the forenoon, in good condition. About 3 to 5 per cent of the bees were dead. The queen was alive and active. They are of fine color; the queen is very beautiful. I am well satisfied with the lot. I have given them some unsealed brood and honey, and will try to build them up rapidly. Express charges were 50 cts., which I think very reasonable. T. JAQUETT.
Newark, Del., Sept. 27, 1889.

I want to flatter you on your promptness in filling orders. The sections, foundation, and wax-extractor, all came in good time, and in good order. The sections are nice; the foundation is fine, and the wax-extractor is a daisy. The reason I had them sent by express was, I wanted to use them this summer, and I did not know whether they would get here in time by freight. T. BROWN.
Cloverdale, Ind., July 11, 1889.

GLEANINGS A NECESSITY.

I would say that I regard GLEANINGS as a household necessity, and a blessing to myself and family, not only temporally but spiritually. I think it would please you to know that "Uncle Amos" has a warm place in the hearts of all my family. Even our little four-year-old baby Georgie talks about

Uncle Amos, and says he loves him. May you live long, and continue to lead us by example and precept in the way you have in the past, is my desire. S. H. BEAVER.
Tamora, Neb.

THE DOVETAILED HIVE JUST THE HIVE FOR THE GREAT MASS OF BEE-KEEPERS.

The Dovetailed hives ordered of you arrived in first-class order, and freight very moderate. We admire your ingenious method of crating, and are much pleased with the hives. We consider the Dovetailed as just the hive for that great class of bee-keepers who, farmers also, make bee-keeping an extra; have few appliances for putting hives together, and devote their attention to the production of comb honey exclusively. R. N. LEARNED.
Newton, N. J.

PLEASED.

Editor Gleanings:—I must acknowledge that you are the most prompt and reliable dealer I have tried as yet. I have been doing business with you in father's name, C. C. Bartlett. The goods have all got here in good shape; the mandrel and saws sent last winter are doing the best of work. I think GLEANINGS a fine paper, and the A B C book is now a superb volume, of which you may well be proud; and didn't you hit it, though, when you improved the Clark smoker? I wish you success.

Our honey season has been fair here. The bees swarmed to Christmas. Our main dependence is alfalfa. We have had no rain this summer, but were favored with snow last winter, so we have done very well. BART BARTLETT.
Vernal, Utah, Aug. 26, 1889.

TRAVELS AND THE HOME TALKS.

I have not yet received my GLEANINGS for July 15, but I have received the one for August 1. Thinking it must be lost I thought I would ask you to replace it, as I should not like to miss the first part of your trip to Wisconsin. I may say I most thoroughly admire your Home talks, as they seem to breathe such a Christian spirit. I believe I myself have been quickened to self-examination by your practical every-day life sort of expositions on our Savior's teachings. I myself belong to the blessed Master, whom I try to serve in the Sunday-school, the pulpit, and by the every-day life of one who tries to love his neighbors.

In regard to bees, blacks are the best here, all things considered. Imported Italians are no good in the north. My bees, 28 colonies, are working now on heather, after doing well on clover. I have the Scotch hills here in sight on the north, the Cumberland tells, with Skiddaw in full sight on the south. J. STORMONTH, JR.
Kirkbride, Cumberland, England, Aug. 21, 1889.

"THY WORD IS A LAMP," ETC.

Wouldn't it save some trouble if the editor of GLEANINGS carried a small "pocket-lamp" with him on his travels?

[The above comes on a postal card, written in a feminine hand, but no name was signed. To be sure, you are right, my good friend, and I have wondered that somebody did not take this matter up sooner. The reason why I did not have a Bible in my pocket was that I started out, as I usually do, with the expectation of going across the country with horse and buggy, and a good many times on foot; and I have learned by experience that every thing that can be dispensed with is a hindrance; therefore I did not carry even a Bible, supposing that, as a matter of course, I could readily lay my hand upon one anywhere; and I was not once disappointed, except in that great hotel. When I started away my wife brought me my Sunday-school quarterly; but I told her it would cumber my pockets, and I thought that I should be able to find one of some kind or other, wherever I was stopping. Another thing, I like to get hold of a Bible where I stop, and see how much it is used. I like to see a soiled, well-worn Bible. If it has a little beeswax and propolis on the lids, I do not feel troubled at all. I had decided, however, before your friendly suggestion came, to be provided with a "pocket-lamp," and one has already been laid aside, with a small copy of Gospel Hymns, to be ready for the next start off. Now, good friend, had you given me your name, possibly I might have called on you and asked for your Bible.]

HONEY COLUMN.

CITY MARKETS.

BOSTON.—Honey.—Honey is moving fairly well from 16 to 17c, with occasionally an extra fancy lot at 18c. Some large retail dealers in our city secured quite a quantity of white honey, averaging about 13 or 14 ounces to the comb, and are selling it at 15c per comb. This has tended to demoralize our other retailers, as they want to compete, as the large retailers have filled their windows with the honey, and marked it very prominently. Two-pound combs a little scarce, selling for 16 or 17c. Extracted, 8@9c. No beeswax on hand.

Oct. 10. BLAKE & RIPLEY,
Boston, Mass.

COLUMBUS.—Honey.—Arrivals of honey have been liberal. Owing to large shipments of western honey, bought there at 11c, being placed on the market, the price has been lowered to 15c, at which figure we had to sell a good part of our consignments, to meet competition. Large quantities still on hand, and the outlook is for still lower prices. No sale whatever for dark honey.

Oct. 10. FARLE CLICKENGER,
Columbus, Ohio.

CINCINNATI.—Honey.—There is a quiet but steady demand for choice comb honey, at 15@16c in a jobbing way; dark is of slow sale, at 10@12c. Demand from manufacturers is fair for extracted honey, and it is good for best qualities for table use.—Beeswax is in good demand, at 20@22c for good to choice yellow on arrival.

Oct. 12. CHAS. F. MUTH & SON,
Cincinnati, Ohio.

CHICAGO.—Honey.—Honey is selling with more freedom this month at the following range of prices: Choice white comb in pound sections, 13c; crooked or stained combs, 10@12; dark, in comb, 9@10; extracted, white, in kegs or cans, 7; in bbls., 6½@7; dark, 6. Beeswax, 25c. R. A. BURNETT,
161 So. Water St., Chicago, Ill.

NEW YORK.—Honey.—Honey is in excellent demand. We quote: Fancy white, 1-lb. sections, 15@16c; 2-lbs., 13@14; fair white, 1-lb., 13@14; 2-lbs., 11@12; buckwheat, 1 lb., 10@11; 2-lbs., 9½@10. Extracted, basswood and white clover, 8c; orange blossom, 8½; buckwheat, 6; California, 7½; Southern, 7½c per gal.

Oct. 11. HILDRETH BROS. & SEGELKEN,
New York.

ALBANY.—Honey.—Market some easier, but demand good, and any attractive desirable style comb sell well. Are short of small comb buckwheat honey. Clover, 15@16c; mixed, 13@14; buckwheat, 12@13. Extracted, buckwheat, 6; clover, 7½@8.

Oct. 11. H. R. WRIGHT,
Albany, N. Y.

DETROIT.—Honey.—Best white, in one-pound sections, 14@15c. Sales slow; supply not large. Extracted, 8@9.—Beeswax, 23@24.

Oct. 11. M. H. HUNT,
Bell Branch, Mich.

ST. LOUIS.—Honey.—No change in market, though firmer. Demand fair.—Beeswax, prime, 22c.

Oct. 11. D. G. TUTT GRO. CO.,
St. Louis, Mo.

KANSAS CITY.—Honey.—The receipts are very light. Demand increasing. We quote: 1 lb. comb, white, 13@14c; dark, 10@12; 2 lb., white, 12@13; dark, 10@12. Extracted, white, 7@8; dark, 6.—Beeswax, none in market. CLEMONS, CLOON & CO.,
Oct. 12. Kansas City, Mo.

PHILADELPHIA.—Honey.—Honey in 1-lb. sections (No. 1) is in good demand. Quite a number of inquiries for same. Yellow beeswax is wanted at 23c. Good outlet for both. CHAS. E. SHOEMAKER,
Oct. 9. 44 So. Water St., Philadelphia, Pa.

FOR SALE.—1000 lbs. white-clover honey, in 60-lb. tin cans. Will put on cans here at 8c per lb.
20-21d R. I. BARBER, Bloomington, Ill.

FOR SALE.—About 1000 lbs. buckwheat extracted honey, put up in kegs holding 150 to 160 lbs. each. I will take 6c per lb. f. o. b., kegs thrown in. Will take beeswax in exchange. J. I. PARENT, Birchton, Saratoga Co., N. Y.

FOR SALE.—I have a quantity of choice clover honey in scant 1-lb. sections, and 12-lb. cases, at 15c per lb. (100 lbs. or more). Also 60-lb. screw-cap cans of extracted clover honey at \$4.90 per can; 2 cans in 1 box, \$9.60. Safe arrival guaranteed by freight. OLIVER FOSTER, Mt. Vernon, Linn Co., Iowa.

NOW IS THE TIME
FOR MARKETING HONEY, AND NEW YORK
IS A GOOD MARKET.

We make liberal advances in CASH on consignments, sell quickly at highest obtainable market prices, and pay the net proceeds IMMEDIATELY after honey has been sold. We charge for commission and GUARANTEE of payment, five per cent. Ship by freight to

F. G. STROHMEYER & CO.,
WHOLESALE HONEY MERCHANTS,
122 WATER STREET, NEW YORK.

Vol. XVII.

OCT. 15, 1889.

No. 20.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single number, 5 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

Established in 1873.

PUBLISHED SEMI-MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canada. To all other countries of the Universal Postal Union, 18 cts. per year extra. To all countries NOT of the U. P. U., 42 cts. per year extra.

OUT-APIARIES, NO. XVII.

SPECIAL PLAN OF INCREASE FOR OUT-APIARIES.

YOU probably know better than I what plan of increase is best for you; but there is one way that can be used by means of out-apiaries that I think well to mention, and there may be times when you may think best to use it. One year, with plenty of empty combs I increased 12 colonies to 81, and took 1200 lbs. of extracted buckwheat honey. There is nothing specially new about the plan, only that you can easily make bees stay where you put them, if you take them from one apiary to another.

If you please I will take two colonies to work with, as the same thing can be done with a larger number. As soon as the season will warrant it, take the queen with one frame of brood and bees from No. 1; put it in an empty hive which we will call No. 3, and set No. 3 in place of No. 2, setting No. 2 in a new location. Take from No. 1 any frames not filled with brood, and exchange with No. 2 for frames of brood. No. 1 is now full of frames of brood, and has a full force of bees, and will at once go to work rearing queen-cells. You have your own plans for raising the best queen-cells, and can use them; and the day after the queen is taken away from No. 1, or as soon thereafter as convenient, insert in each frame of No. 1 a queen-cell. If you have no better way, I think you will find that No. 1, if you let it entirely alone, will raise some very good queen-cells; and about nine days after you have taken the queen away, go to the hive and cut out a good cell from a frame which has more than one cell, and insert it in a frame which has none, so that each of the frames shall have a cell. It is not necessary to destroy any of the cells. If there should be several on one comb it will do no harm. If the cells are inserted in the morning, you will probably find them

fastened in all right in the evening; but if any fail you must insert others. Fasten the frames if necessary. Next day take the hive to the out-apiary, making sure that the bees have abundant ventilation. When you get to the out-apiary, smoke the bees so that they will not immediately take flight, and put each frame, with its queen-cell and bees, into an empty hive, thus making a nucleus of each frame, giving each an empty comb. You thus see that each nucleus has its equal share of bees of all ages, and I don't know of any way in which you can thus evenly divide them without taking to another apiary.

In two weeks from the time No. 2 was moved, it will be ready to be operated upon the same as No. 1. Put its queen in a new hive, to be called No. 4, and put No. 4 in place of No. 3. No. 2 can then be taken to the out-apiary, as also No. 3 and No. 4. If none of the young queens have failed, we have as many new colonies as we had frames with queen-cells; and if the hives are 8-frame hives, there will be nine colonies for each one we started with. We are not likely, however, to succeed so well as this, and very likely some of the frames taken in No. 2 will need to be given to some of the first nuclei that failed to secure laying queens. If the increase is five or six fold, it will be doing pretty well. The first colonies formed will become strong enough to spare some frames of brood, which will be needed to build up those started two weeks later. Then if any of them become crowded with honey, the extractor can be used to give the queen more room.

You will see that this is a good way to form a new apiary, for you are relieving the home apiary at the time of greatest increase of bees; and if you are anxious for increase, it is at least a good way. You might thus take 12 or 15 colonies to a new spot where there was good pasturage, especially fall pasturage, and allow them to build up at their

pleasure with very little attention on your part. If you had no empty combs, of course you could not do so well with empty frames or frames of foundation.

C. C. MILLER.

Marengo, Ill.

I know the above will work, because I have done pretty much the same thing, only I did not have any out-apiary. Of course, an out-apiary would prevent all trouble from going back to the old colony, and you can at any time put bees or frames of brood, covered with bees, wherever you like, and they will stay right there.

VARIOUS MATTERS.

CRATING HONEY SO AS TO HAVE EACH CRATE WEIGH AN EVEN NUMBER OF POUNDS.

YEARS ago, when I first began to put up honey for market, I paid no attention to having the amount in each crate weigh an even number of pounds, but I put an even number of boxes in each crate, and in weighing them I marked each crate by the quarter pound. That is, if a crate weighed 30 lbs. 3 oz. it was marked $30\frac{3}{4}$ lbs.; and if it weighed 32 lbs. and 6 oz. it was marked $32\frac{3}{4}$, thus making the $\frac{3}{4}$ the nearest to the one which it weighed. I followed this plan for several years, when I saw some labels advertised, to paste on each crate, which gave the weight of the gross, tare, and net, in ounces. These seemed to me to be handy, so I sent and procured some of them, using them the next year. In sending in returns that year, not a single commission merchant said any thing about the ounces, except to grumble about the way I had marked the honey, and advised me to make my crates in the future weigh an even number of pounds, if I would obtain the best prices for my honey, and save them much annoyance and vexation. The next year found me making each crate weigh an even number of pounds, which thing I have kept up ever since, and in no single instance have I had returns made for a pound less than I shipped. As long as glass was used on each section or box, the matter was very simple; for all I had to do was to sort out the thin glass into piles of the right number for a crate, and the thick ones in the same way, till I had the number of piles that I would have crates of honey. These piles were now weighed, and a label put on each one, telling what it weighed, so that, when the sections of honey were brought out for each crate, and placed on the scales, the pile of glass was taken which would make the whole weigh an even number of pounds when the glass was placed on the honey. By adding this to the tare of the crate I had the gross weight, or just what the crate weighed when it was all ready for market. Later on, when it was not desirable to glass the honey, I sorted the pile of honey all over, placing all the lighter sections in one pile, all of the medium in another, and all those that were extra well filled or the heavy ones in the third. I would now take all the sections for a crate from the medium pile, which would contain the larger bulk of the honey; then if they did not weigh an even number of pounds I would exchange some of these medium sections for either the light or the heavy ones, as the circumstances might require, till the right amount was secured. I know this is a little work, but I have been satisfied that it

well paid me for so doing. Having just crated my honey for market, and thinking that I had never given this item before, led me to do so now. Try it, brother and sister bee-keepers, if you have not already done so, and see if you do not think this a good way.

NON-SWARMERS.

I see by page 733 of GLEANINGS for Sept. 15th, that the editor thinks that the plan I gave to prevent swarming would be the same as "hiving the new swarm and setting it on top of the old one, then in a few days destroying the queen-cells below and shaking the bees and queen in front of the lower one." Not so; as, in this latter case, the bees and queen are on the brood which they had before they swarmed; while in the plan I gave, the bees below would be building comb in the lower hive the same as would any swarm hived in an empty hive, while the brood above would be hatching (with few bees to cover it), and coming down below, so that the strength of the colony would be kept at the highest pitch all through the honey harvest, while during the first 21 days the queen would have all the cells built by the bees to occupy with eggs. I think all will see that the two plans are very different; the first having an uncertain element in it, while the latter places them in that certain condition generally enjoyed by all new swarms during the first 25 days after they are hived.

CUTTING OPEN QUEEN-CELLS TO SEE WHEN THEY WILL HATCH.

On page 754 of same number of GLEANINGS are found some of the points of merit the queen-cell protectors possess; but there is one thing not mentioned there which has been of some service to me, which I believe has never been mentioned. All remember how, in former years, they have been grieved when obliged to spoil one of two nice queen-cells which were built so near together that they could not be separated without cutting into one of them so but that the bees would tear it down and drag out the immature queen. Well, I was not long in finding out that a queen would hatch just as perfectly from a cell having one side gone, if the same was placed in a cell-protector, as she would had the cell been whole, for I have had scores of them hatch perfect queens from such mutilated cells. After finding this out it occurred to me that, if I did not know just when a queen would hatch from a given cell, all I had to do was to remove it from the protector (or do the same before it was put in) and open the cell at the side near the base, look at the immature queen, and put the cell back in again. From curiosity and for experiment I have many times opened a cell to that extent that I could turn the queen out in my hand, look her all over and place her back again; and where care was used I have never known one to fail of hatching a perfect queen afterward. After having looked inside of a queen-cell several times, or turned the embryo queen out in your hands, any one can tell almost to within a fourth of a day when they will hatch. This gives quite an advantage over the past, for many times we have waited for days for the hatching of a cell which finally never hatched at all, on account of the larva dying from some cause or other.

G. M. DOOLITTLE.

Bordino, N. Y., Oct. 7, 1889.

I think, friend D., somebody has mentioned assorting the sections so that each case contains an even number of pounds. I

think each careful bee-keeper will find that it will pay him to do so. It certainly does not pay to leave things at loose ends. Honey is frequently sent us, without the shipper knowing either the gross or tare, trusting all to our honesty. I do not like this way of doing. A great many times we do not care to empty packages of extracted honey, and the weight of the barrel or keg is taken from the shipper, and accepted right along, until it comes to be retailed out.—Years ago I discovered that, during very warm weather, queens, when nearly ready to hatch, would mature just as well out of the cell as in; and I, too, have tumbled them out of the cell into my hand, and put them back again, and had them make nice queens. With the lamp nursery I have had them develop with no cell at all; but I never succeeded with one until it was so near hatching that the legs and wings were pretty fully developed.

ZINC HONEY-BOARDS.

THE VARIOUS USES OF THE METAL IN BEE-KEEPING.

THE invention of the queen-excluding honey-board marks an era in bee-keeping. Popular and useful as these have proved before, we are just learning some of their most important uses, and their possibilities are probably by no means exhausted.

By their use the queen is kept out of the supers, which is of the greatest advantage in extracting. In comb-honey production they are not so necessary, though even here they are very useful, and in some cases indispensable. In dividing, forming nuclei, and selling bees by the pound, it is a great advantage to be able to take bees from a hive without the necessity of hunting up the queen. Queen and drone traps serve a very useful purpose in preventing the loss of swarms and the flight of undesirable drones, though on account of their expense and some other objections they are not in very general use.

A queen-excluding honey-board at the bottom of the hive is much superior for temporary use. To adapt it to continued use, some way of disposing of the drones is necessary. Who will invent an attachment that will lead the drones into a chamber by themselves, from which they can readily be removed, and which will not make it necessary to cut holes in the hive or bottom-board, and will leave the queen-excluding board uninjured for its ordinary use?

Perhaps this is too much to expect, and we shall probably have to combine the drone-trap with the honey-board. Friend Heddon seems to have faith in an attachment to the side of the hive, but has not made the details public. I know that a hole bored through the side of the hive, covered with a small box having a hole covered with a wire-cloth cone on one side, and queen-excluding zinc on the other, answers very well, but I do not like to bore holes in my hives or make a drone-trap a permanent feature in all of them.

RAISING QUEENS ABOVE PERFORATED METAL.

A great deal of experimenting has no doubt been done this season with the new methods of having queen-cells built and queens fertilized above perforated metal. So far as my experience goes, it is

easy to get cells built while there is a queen in full vigor below, though these cells are by no means of the first quality, except under favorable conditions. I have had no success in getting queens fertilized in this way, though I have no doubt that, during the proper season, it would work well. Steady feeding when honey is not coming in freely will probably be necessary to insure success with either plan.

I have had some little trouble this season from the queen going through the perforated metal. This was a lot bought of you two years ago. It seemed as though any queen could go through it whenever she really wanted to; and any strong inducement, such as frames of brood, would be almost certain to bring her through, and I have known queens to go back and forth through it every three or four days. This same zinc, though, almost invariably kept queens out of extracting supers.

I have known some to argue that there was not enough passageway through the break-joint queen-excluding board. Let us see. If I have measured rightly, each perforation has an area of $\frac{3}{16}$ of an inch. The combined area, then, of the holes in a break-joint queen-excluder for an eight-frame hive would be 21.06 sq. in., equal to 27 holes an inch in diameter. The all-zinc break-joint boards for eight-frame hives have, as the combined area of their perforations, 36.85 sq. in., equal to 47 one-inch holes. Of course, some of this area is in corners, and not available for passage; but allowing for this, there is much more passageway than used to be considered abundant with the old-style honey-boards and boxes.

PLAIN SHEETS OF PERFORATED ZINC IN THE BROOD-NEST NOT RECOMMENDED.

The plan of laying a plain sheet of perforated zinc directly on top of the frames does not work well, as usually but a small proportion of the holes is left available for passage. All-zinc honey-boards are not well adapted to use on new hives, as they will sag by their own weight, no matter how straight they may be at first, nor how well nailed to the wood binding. When used on old hives, though, where the zinc is supported in the center by brace-combs, they answer excellently. For the same reason, these boards, when made up, should not be piled up flat, but should be stood on edge. It seems strange that a metal, apparently as firm as zinc is, should thus stretch and sag, but it is a fact.

Dayton, Ill., Aug. 29, 1889.

J. A. GREEN.

THIS SEASON'S OBSERVATIONS.

THE WEATHER, ETC.

THIS year was a favorable one for bees. Golden willow began blooming April 15th, and in a few days the hives were all well filled. We had but little rain from November till the middle of May; consequently the spring was extremely dry. But for all that, bees made a good living through fruit-bloom and buckeye. Locust opened up with fine prospects, but it then began raining, and rained for four weeks. Poplar bloomed profusely at this time, but the weather was too rainy for the bees to do much. Finally it cleared up, and white clover began blooming, though much later than usual, on account of the early drought. Then the bees began to swarm, and kept swarming until July 4. We increased from 20 to 40, doubling up many of the new swarms. Basswood produced but little honey. White and sweet clovers did well.

YOUNG SWARMS ROBBING THE PARENT HIVE.

June 2, we had a second swarm that was hived on frames containing some comb. After a little while I noticed an unusual number of bees going in and out of both the old and new stands. The next day I examined the new stand, and found the combs half built, and completely full of honey. The young swarm had robbed the parent hive of most of its honey. I am confident that they robbed it, for on the evening of the day that the swarm came out it was pretty cool, and not a bee was moving about any hive except those two. I got some flour and sprinkled on the bees coming out of the old hive, and found them all going into the new swarm. We have had several cases of this kind, and right in the midst of a good honey-flow. The parent hive never offers any resistance. But no harm is ever done by this kind of robbing. They never rob except the first day after coming out. I have seen them robbing quite lively late in the evening, and next morning not a bee would go back. One hive is robbed a little every year in this way by its first swarm.

DRONE ASSEMBLIES.

I am inclined to think that drones do not go very far to congregate. This year I heard the loud roaring of drones high up in the air in several places in our locality. Some of the assemblies were not more than half a mile apart.

RED CLOVER.

This year the second blooming of red clover produced honey quite freely. The blossoms were short, and the bees could easily reach the honey. During the drought, when the ground was extremely dry and the air very hot, the bees gathered honey in large quantities from it; and at the present date, Sept. 16, they are still working hard. The brood-chambers are very full of honey; in fact, brood is to a great extent crowded.

HONEY-DEW.

About the 10th of August, honey-dew began to appear on the maple-trees. It came in small quantities at first, but increased each morning for about a week. After that about the same amount fell each night until Sept. 6, when it suddenly ceased. The bees worked on it from daylight until about 10 o'clock. At the end of that time it disappeared, leaving stains on the leaves where the drops had been. It appeared more on warm nights, when there was lots of dew, and lasted longer on days that were cloudy. It always appeared on the upper side of the leaves, never on the under. It came in drops the size of small raindrops; and while some leaves would be covered with it, others would have but little or none. The top branches of the trees produced a great deal more than the lower ones. Some trees had three or four times as much honey-dew on them as others. It had a very distinct flavor of maple syrup about it, and when the sun shone on it a little while, it became thick like molasses. I have seen drops on some leaves, large enough for three or four loads for a bee. On some mornings, when it fell profusely, it could be found on the grass, weeds, and small bushes under the trees. I have seen the small maple sprouts (that just came up last spring, and as yet having but two leaves), distant from any other tree, and yet its two little leaves would be covered with honey-dew. I am confident that this honey-dew does not fall as the dew of the night, but that it is a secretion of the leaves, and that it comes from the limbs and body

of the tree, and is secreted by the leaves; for lately, in cutting up live sugar-tree limbs I noticed a liquid oozing out of the wood close to the bark; and in tasting it I found it to be sweet, having a taste similar to that of honey-dew. I also saw bees flying around the piles of freshly cut wood. When a freshly cut log was left in the sun a while this sap would ooze out between the bark and the wood, and form a bitter-sweet sticky gum. This is something I never noticed before. CHAS. L. GREENFIELD.

Somerville, O., Sept. 16, 1889.

Young swarms robbing the parent hive has been before mentioned. Like yourself, I have been obliged to decide that drones do congregate in a good many places, especially in the vicinity of large apiaries. Your remarks in regard to honey-dew on the maple seem to indicate that it may be a secretion of the plant. Friend France mentioned, while I was there, that one season he saw the bees working strong on the leaves of corn, right where they are united to the stalk. Selecting a hive where they seemed busiest he put an empty comb in the center of the brood-nest. In a day or two it was full, and he threw out the honey with the extractor, put it on the table, and asked the boys to decide what kind of honey it was. One of them replied promptly that he could not tell, but it tasted exactly like the juice from chewing a green cornstalk. This honey was a saccharine secretion directly from the corn—no aphides about it. I have seen it sufficient to keep the bees busy a while in the morning. Now, I think it is possible that maple may, under some circumstances, secrete a sweetish substance in the same way.

AN AVERAGE CROP.

FRANK McNAY REPLIES TO E. FRANCE.

NOTICE on page 738 of GLEANINGS for Sept. 15, that E. France criticises the answers given by some of the respondents in regard to the average crop of honey. He is mistaken in supposing that the honey season opens and closes at the same date in all locations, for I notice that he now reports the same as he did on Aug. 3d, while I at that time considered my crop about half gathered; and as I had taken 20,000 pounds from 350 colonies during the first half of our season, I reported it an average crop *so far* (see question d, Statistics). I now report 26,600 pounds for August and September, making a total of 46,600 pounds for the season, of which 3050 is in one-pound sections, from 65 colonies, and 43,550 pounds extracted from 285 colonies. My bees are in six apiaries, from 35 to 75 colonies in each, located from $\frac{1}{2}$ to 5 miles from basswood; and as it is often asked how far bees may be located from basswood or other forage, and work to advantage, I have kept an accurate record of dates of extracting in each apiary, showing amount taken, distance to forage, etc.; and if you desire I will send you a tabulated record of the season's work. Our work was done with Bingham smokers and knives, and five Novice extractors.

Mauston, Wis., Oct. 1, 1889.

FRANK McNAY.

Let us have the tabulated record, friend M. Your point with respect to the statistics is well taken.

WEIGHT OF BEES.

PROF. COOK REVIEWS THE SUBJECT.

I HAVE felt much interested in this matter of the weight of bees. I find in Keys' old work, p. 92, the following:

WEIGHT OF BEES.

100 drones.....	1 oz.
293 workers.....	1 oz.
4,640 workers.....	1 lb.
915 workers.....	3½ oz.
1,830 workers, a pint, or 6 oz. and 5 drs.	
3,660 workers, a quart, or 12 oz. and 10 drs.	
29,280 workers, a peck, or 6 lbs. 5 oz. and 6 drs.	

Keys adds:—"This statement is made on an average; for they will not prove twice exactly alike, because of their different degrees of fullness, etc."

I asked one of our students, Mr. John W. White, of Lancaster, Wis., to weigh bees, and see how ours agreed with those of Keys, and with those reported by you in GLEANINGS. Mr. White gave his paper before our Natural-History Society last evening. Like Keys, Mr. White found the variation large. He also found that bees a short time dead weighed less than those just killed. I have found it necessary to kill bees, when weighing, as the motion of their wings will often make a large difference in results. Our bees seem heavier than either those of Keys or those at Medina. Let me say, that our weighings are all done on scales so delicate that they will almost weigh a thought or sigh. Mr. White weighed seven lots of ten each. These bees had been long fasting, and were just beginning to die of starvation. The average was 4106 to the lb. While these bees were all near the starvation limit, yet there was considerable variation in weight. Mr. White chloroformed these bees. After they recovered from the stupor, he fed ten bees all they would take, and then weighed them. These weighed 15 milligrams per bee more than the others, or 3626 bees to the lb. The results of Mr. White's weights were a surprise to me, and so I thought I would verify their accuracy. I weighed 20 bees that were caught from the hives. They were then carried in my pocket for two or three hours in a cage while walking about. These bees weighed 108 milligrams per bee, or at the rate of 4222 to the pound. Another lot of the same number, taken after they had sipped all that they would, were chloroformed, and weighed at once. These weighed 123 milligrams per bee, or at the rate of 3781 to the pound. So, friend Root, I think your old average, 4000 bees to the pound, is more nearly correct for our bees than is your more recent estimate. I feel very certain that our bees will average 4000 to the pound; and I think that, when full fed, they will hardly reach more than 3330. You will note that, when starved, they reach only 4225 to the pound. Our bees are a cross between the Syrian and Carniolan. There may be a trace of Italian and German blood, and doubtless is. I had always thought that the Syrian race seemed large, and visitors often say, "Your bees seem very large;" yet I had not supposed there could be so much difference. Of what race were the bees you weighed?

Agricultural College, Mich.

A. J. COOK.

The account of your weighings is very interesting, friend Cook. Your figures are considerably lower than those we report in GLEANINGS for August 1, page 643. If we were both accurate in our weighings, then there certainly must be a difference in the

size of the bees. But this, it seems to us, ought not to account for *all* the difference. Although your scales are probably exceedingly sensitive, yet it seems to us there must be some little chance for variation, because friend White weighed only *ten* bees each time; and from this as a basis he figured the number in a pound. We have some scales here at the Home of the Honey-Bees that are sensitive enough to show a variation when a bit of paper is thrown upon the platform. Now, instead of taking ten bees we weighed a thousand, and then calculated the number in a pound, the thousand bees having been counted by a careful man. Now, do you feel sure that your scales, however delicate they may be, would always record the exact weight of *only ten* bees? The bees we weighed were Italians. They had been dead but a few hours, and had but a little honey in their honey-sacs. You say the bees you weighed were a cross between Carniolan and Syrian. The Carniolans certainly do *look* larger than Italians; and according to Mr. Cheshire's measurements they are larger. We have seen Syrians that appeared larger than Italians; yet to us most of them seem smaller. Would it be too much trouble for Mr. White to weigh some pure Italians, and count out, say, a hundred, and weigh them? We will send him some in a mailing-cage. Perhaps the difference in the size of bees will account for the difference in our results.

MANUM IN THE APIARY WITH HIS MEN.

HORSES IN NIGHT-CAPS AND NIGHT-GOWNS.

"SCOTT, have you a load of honey ready for me to take home?"

"Yes, sir; two of them."

"Good! the more the better. I see the bees are not doing very much to-day. I think basswood is about past, as there seem to be a good many bees around the door of the honey-house. I will back the wagon up to the door, and you may come and help me cover up the horses."

"There, take this thin cotton hood and cover the old horse's head with it while I do the same by the colt. See how the old horse holds his head down; he knows what it all means. Yes, he knows as well as I do when we are near an apiary. He has had experience with stings, hence he is always willing to have his head covered. There, now we will throw these blankets (made of same material) over their bodies, and tie them in front to protect the breast. There, you see they are well protected; and as these covers go down to their knees, the bees do not hang around the horses when thus covered. Formerly we used only our coats to throw over the horses' heads. That answered very well, as that caused the horses to keep quiet. Although our horses were never stung when only the coats were used, yet I was always afraid they would be; and as the coats had to be removed before starting with a load, they were then liable to be stung before getting out of range of the bees. But with these blankets it is different, as we can drive all the way home with them if we wish; but we usually remove them half a mile away from the yards. These

blankets, or protectors, being made in two parts, are quickly put on or removed, without being obliged to draw the lines through them, as one part goes over the lines and the other under. As Fred usually hauls all the honey, and as he leaves his yard tomorrow for that purpose, I am going to take a photograph of him with a load of honey, just as he arrives home with it, and send it to Mr. Root, as he may suggest some improvement.

"I will now get into the wagon, and you may hand me the clamps of honey just as fast as you can handle them; because, as soon as the bees scent the honey they will become altogether too familiar, therefore I want to get loaded as soon as possible, and be off. You can see this wagon-box was made expressly for this business. We can put in 32 clamps on the bottom for one tier, and 5 tiers will make 160 clamps, and 16 sections to the clamp gives us 2560 sections, making a little over a ton of

how to take them off and get the bees out quickly, I have left them all on that were on at that time. Why do you leave them on three or four days after the bees have stopped getting honey?"

"It is because there are always some sections that are not finished up at the time basswood has gone by; and as there is usually more or less unsealed honey in the brood-combs at that time, I leave the sections on a few days to give the bees time to carry it up and complete the sections. But in spite of all that, we shall have a lot of unfinished sections again this year. There, now I have got my smoker well to going, and we are ready to proceed. You say you have 117 colonies here that have clamps on them. All have two, and some three clamps; now, how long do you think it will take us to remove the clamps and get the bees out, and carry them into the honey-house?"

"Well, I do not suppose we can do it all to-day."

MANUM'S ARRANGEMENT TO PREVENT HORSES FROM BEING STUNG WHILE HAULING HONEY.

honey. Fred had this box made to suit his own notion, so that the clamps for shipping-crates just fit, both lengthwise and crosswise, which makes it very convenient for us. You may hand out two clamps more, which will just finish my load. Now, hand me that enamel-cloth covering to spread over the load to protect the sections from dust or rain, or the honey from the hot sun. There, now all is secure. You may now come out here; and as soon as I get seated, with reins in hand, you may remove the blankets and away I go. Good-by!

"How do you do, Will? I thought I would come to-day and assist you in removing all the clamps from off the hives. I believe it is four days since I was here and told you basswood had passed, is it not?"

"Yes, I think it is; and you were right, though I could not believe it; but the scale-hive has not gained a pound since that day; and as you told me not to take off any of the clamps for four or five days, and that you would come up and show me

"It is now 9 o'clock. Well, I think we can get every section in the honey-house by noon if we have good luck in getting the bees out of them. We will commence here at No. 1, and take them by course. You may look on while I go through this row, and then you can take a row yourself. There, now, watch me closely. I raise the cap, pull off the enamel cloth, smoke the bees a little to scare the queen down out of the sections, should she chance to be there; and while she may be doing so I go to the next hive and do by that as I have by No. 1, and so on through the row of 20 hives; and on my return to No. 1 I let down the caps to protect the uncovered sections from robber bees. I now raise the clamps from No. 1, set them on the ground edgewise, get the honey-board (brood-box cover) from under the stand, cover the brood-box, and take up the clamps and place them on the honey-board edgewise, and close the cap and go on to the next hive, and so on through the apiary. You again have the opportunity of enjoying the conven-

ience of having small or half-size clamps, for, as you see, if they were full size they could not rest on the brood-box and permit of the cap closing down tight. Why, I would not exchange these small clamps for full-sized clamps, if any one would give me the large ones free of charge; in fact, I should hardly know how to manage with them.

"There, now, we have the clamps all off, and there are 286 of them, which would be equal to 143 full-sized clamps, and we have been an hour and 20 minutes in removing them. We will now go to No. 1 and see what progress the bees have made in getting out of the sections. Well, they are doing very well, but we can help them some by opening the caps, as the escapes are so small it is rather slow work; and especially where the sections are not full of honey they have more bees in them. We will now go right through and raise the caps. You may take one row and 1 one. There, just raise each cap; and as you do so the bees will fly out in all directions, and make for the entrance. Leave the caps up until you go through the row, as that will give the bees more time to fly out; on your return, close them, and take another row, and so on through the apiary; then we can commence at No. 1 and repeat the operation the second or third time if necessary.

"Now, as the bees are out of nearly all the clamps we will carry them in. We can carry two at a time, and even three, where there are three on the hive. If you find a clamp that the bees do not seem to leave, it will indicate that the queen is in it, or that there is brood in one or more of the sections. In either case the bees will not leave, and you will have to place the clamp on the ground at the entrance, and remove the sections one by one, and shake the bees out of them in front of the hive, that the queen and bees may run in. It is not often by this method that we get the queens into the sections. So far this season I have found but one queen in the sections, and have found only three sections with brood in them.

"It is now half-past eleven, and the honey is all in except the two last rows. These you can carry in at your leisure, after the bees are out of them; so, now, I will go home. You see it is a short job to remove the sections from 100 hives, and get the bees out, when one understands how to do it, and with the right kind of hive and fixtures. You may now, as soon as you can, scrape the propolis off the top and bottom of the sections as they are in the clamps, so that they will not stick together when piled one over the other. You will have but a few days longer to remain here at the apiary, as you will be needed at home to assist in preparing the honey for market."

A. E. MANUM.

Bristol, Vermont.

Friend M., in behalf of our readers we tender you our sincere thanks for your very ingenious night-caps and night-gowns for the horses. The experience of a man who raises honey by the ton is certainly worth considering; and such appliances are usually the outcome of the wants and needs of a large business. Our readers will notice that you use the term "clamps" where we say "crates" for the box that holds the sections as they stand on the hive. I thought, a short time ago, that J. A. Green struck on the shortest method of getting the bees out of the boxes; but I do not know [but

you are ahead of him. I should not have supposed it possible to take the honey out from 100 hives between 9 and 12 o'clock. Your process of inducing the bees to come out of the sections and go down into the hive is indeed novel. I suppose that this, too, was the result of much experiment and much experience. When I worked with Dr. Miller I thought his system and plan could hardly be improved upon; but with the vivid explanation you give us of your arrangement, perhaps you are ahead. It may be, however, that you will get along better on your plan, and he will get along better on his; but for all that, it is extremely helpful to have it explained so we can understand it, just how each large honey-producer goes about to do his work.

WHERE SHALL WE HOLD THE NEXT NATIONAL BEE-KEEPERS' CONVENTION?

SHALL IT BE CHANGED FROM BRANTFORD, ONTARIO, TO BUFFALO, N. Y.?

The *Canadian Bee Journal* for Sept. 18 contained an editorial touching upon a point that I had been thinking of for some time. It reads as follows:

While at Buffalo we lost no opportunity of inviting our American friends to be with us at the coming international convention, to be held at Brantford in December, and we were encouraged by many promises to be present. We hope that our Canadian bee keepers will not forget to be present, and give our visitors such a welcome as they deserve. By the way, would it not be mere justice to place the holding of the next convention at Buffalo? The bee-keepers there would like it, and it will give Canadians a good chance of again being present. Besides, the Eastern States are deserving of it in their turn. Think of it, and come prepared to do the matter justice, in the best interest of the association.

This set the ball rolling; and, of course, in view of the foregoing considerations I could not help giving it another boost by writing the following letter to Dr. Mason, president of the Association, which will explain itself:

Friend Mason:—The last leading editorial in the *Canadian Bee Journal* for Sept. 18th strikes upon a point that I have been thinking of for a long time. The reason the next international convention was located at Brantford was because its secretary lived there, and could see to all the necessary business; but now I am informed he has moved away, and has been away for some time. The publication of the *Canadian Honey-Producer* has also been discontinued. Now, the question comes up, What attraction or what reason is there for having the convention in a small town in Canada, with nothing particularly to call it there now? The population of Brantford is only 13,000, and it is but 70 miles from Buffalo by rail. Why wouldn't it be a good scheme to change the convention to Buffalo, on the border of the two countries, in a city of 250,000 population, and in the vicinity where some of the best bee keepers in the world are located? We can surely get better rates of travel to Buffalo. Furthermore, there is a good live man by the name of O. L. Hershiser, with whom you are acquainted in that vicinity, and you may be sure he will leave no stone unturned to make the next international

a success so far as accommodations, rates of travel, etc., are concerned. Buffalo in the winter time is a place of great resort, on account of the Falls, and I am satisfied that a much larger attendance can be had by some outside attraction than by bees alone. At New Orleans there was the largest attendance at the international in its history; and the reason of it was the World's Exposition. We were interrupted a little, it is true, by those coming in and going out; but I would a great deal rather attend a convention where there is a large attendance with some interruptions than a small one-horse affair with an international name and no interruptions. Now, my better half and I, and, in fact, the whole of the Roots, want to see Niagara Falls in the winter. For the sake of the women, therefore, and for the sake of securing the presence of the New England and New York bee-keepers, exert your influence in favor of Buffalo, N. Y. The Canadians, according to the C. B. J., will be just as willing to attend. There is nothing at Brantford now to attract the convention, and there is no reason why it should be held there. I will write to Prof. Cook, and also to Mr. Newman, and the secretary, Mr. Holtermann. The latter, under existing circumstances, would, I think, just as soon have it at Buffalo as at Brantford. We changed our place of meeting last year, and why not change it now? Times and circumstances alter things very materially sometimes. Whatever you may think or say, remember that at Brantford there used to be a bee-journal and an editor of a bee-journal, and a secretary of the International Bee-keepers' Association. These attractions are now all gone. ERNEST R. ROOT.

Medina, Ohio, Sept. 24, 1889.

Hardly deeming it advisable yet to do any thing about it in print, I sent press copies of this letter to Prof. Cook, who originally proposed meeting at Brantford, and to the editor of the *American Bee Journal*, Mr. Newman. The following replies were received, all of which seconded the change. The first one is from the president, who writes as follows:

Friend Ernest:—Yes, I am in favor of a change of the place of meeting of the international convention, *provided* the Canucks so desire. Come to think about it, though, I don't think that it is any of their business, with the possible exception of Messrs. Jones and Holtermann. I believe they are the only members in Canada. But why not put it at Niagara Falls, on the Canadian side, then we should be right where we could all see the "beauty" without leaving the convention. I am willing to go anywhere my friends will allow; and if I am short in December, you'll not see me at the convention; but I *hope* to be there, and Mrs. Mason with me. A. B. MASON.

Auburndale, O., Oct. 1, 1889.

I think I should still prefer Buffalo as the place of meeting, to Niagara Falls itself. Buffalo, besides being centrally located, is so near and accessible to the Falls that those who so desire can visit them *after* the date of the convention. If, on the other hand, it were held at the Falls, there would be more or less interruptions *during* the session. In other words; Buffalo would be just near enough to be an attraction, and yet sufficiently removed from the roar of the great cataract to avoid interruptions.

Prof. A. J. Cook writes in this manner:

Dear Friend:—I think your reasons are good. We all only wish the best interests of the society. If they would be best served by changing to Buffalo, as seems likely, then I say Buffalo. I see no objection unless the secretary or the Canadian bee-keepers object. A. J. COOK.

Agricultural College, Mich., Sept. 30, 1889.

Brother Newman indorses it in this vigorous style:

Friend Root:—Yours is received, with press copy of letter to Dr. Mason, which I have read carefully. If the Canadians don't object seriously, I see no reason why the convention should not be at Buffalo. Our best convention was held at Detroit in 1885, on the border between the U. S. and Canada. The meeting at New Orleans was not one of the National Conventions. It was an *extra*, but it was good, and just as you say. Count me and the *American Bee Journal* in favor of Buffalo, and send me *advanced proofs* of matter for GLEANINGS about the change, and I will *second your motion*, and support it to the best of my ability. T. G. NEWMAN.

Chicago, Sept. 30, 1889.

Perhaps I should have sent a press copy to the secretary, R. F. Holtermann, now of Romney, Ontario, Can., but not then remembering his address it was overlooked until now. I feel quite sure he will indorse the change.

Now, then, you have the full facts before you. That we may ascertain the pleasure of the members of the Association, I suggest that those who favor the change, and also those who do not favor it, write directly to Thomas G. Newman & Son, No. 925 West Madison Street, Chicago Ill., recording their vote; and Messrs. Newman, after receiving them, can transmit them to the secretary of the society, who will act accordingly.

BEESTINGS; NOT ALWAYS A CURE FOR RHEUMATISM.

A GOOD TEST.

I SEE so many good writings in GLEANINGS that I can not begin to answer them; but as you said you want facts respecting bee-stings as a remedy for rheumatism, I will give my experience. I have handled bees for 32 years, and I have been troubled with rheumatism for 26 years, brought on by scarlet fever, and I have been stung I don't think I can guess how many times, and so I won't try to tell; but let me tell you one instance: This August a very large swarm of one-banded Italian black bees came out on a very hot afternoon, and clustered in the very top of a tall locust-tree. I climbed up, without any protection at all, and got almost in reach, with pocket-knife to cut the limb, and it split off with the weight of bees, and they scattered down the tree and down all over me, and up my shirt-sleeves, and up my trouser legs, and in my hair, and all commenced to sting. I came down that honey-locust in double quick. Rheumatism did not hurt me a bit for a few minutes; but when I got veil, gloves, and myself tied all around bee-proof, and smoker in one hand, rheumatism settled just as it was before; but a little kerosene took all the bee-stings out in a few minutes. But bee-stings are not as bad as mosqui-

toes on me. I have neighbors who get stung very often, and one sting on the face will swell the eyes almost shut and they still have rheumatism. The stings did help my rheumatism, though, until I got myself separated from the bees, but it is no better since than it was before.

BLUE HONEY; JAPANESE A BETTER HONEY-PLANT THAN SILVERHULL BUCKWHEAT.

Well, did you ever see blue honey? My bees gathered blue honey, I think honey-dew, off the green leaves. I saw the bees licking sweet dew in the morning on chestnut leaves. They all quit the buckwheat and went to licking the leaves. Japanese buckwheat is a little better than silverhull, as the blossoms are more in bunches, and don't dry out as quick as silverhull, and the bees work longer on the Japanese than on silverhull; but I don't think a bee gets a load on one any quicker than on the other; but the Japanese is the best buckwheat for the farmer to raise. It grows larger on poor soil, and stands up better on rich soil, and yields more per acre than any other grain in bulk. I don't think there is any more grain on a stalk than on a silverhull stalk; but Japanese grains are about four times as large as silverhull, and of course a bigger yield, and the stiff thick stalk on Japanese makes it more valuable for cutting and gathering.

SETH NELSON.

Wistar, Clinton Co., Pa., Sept. 8, 1889.

We should hardly hope that bee-stings would be a permanent remedy for rheumatism. If it answers in warding it off from season to season, we ought to be thankful.

THE CONE-CASE BEE-ESCAPE, AGAIN.

FRIEND GREEN PROPOSES A PLAN TO REDUCE THE LABOR OF EXTRACTING TO A MINIMUM.

WITH regard to the Reese bee-escape, I do not mean to say that it will invariably remove all the bees. Generally the super will be left entirely free of bees, but often there will be a few left—so few that they are not worth considering. I take the super into the honey-house, stand it on end on the floor, and in a few minutes all are gone. When there is any brood in the combs to be removed, I know of no way to get all the bees off except brushing, or the use of a very liberal amount of smoke. There should be no brood in comb honey, though, and perforated zinc will easily keep it out of extracting-combs. Just think how much easier and nicer this makes the production of extracted honey! No shaking or brushing of bees, with the attendant stinging and daubing! no brood to bother; and where there is no brood there is seldom pollen, so that the quality of the honey is not injured by either of these causes. Now, if I thought I could ripen the honey properly I would extract it before any of it was sealed, thus doing away with the uncapping. I would have one of your new-fangled extractors that would hold all the combs in one super and throw out all of the honey at one operation. Wouldn't that be getting down to business? In this way it would not be a difficult matter for one man to extract all the honey from quite a large apiary every day, if desirable, thus leaving the bees nothing to do but to gather nectar. Seriously, I have half a mind to try it.

I have corresponded with manufacturers of evap-

orators, but have not found any thing that seems to be what is wanted. It may be that honey would not be greatly injured by being evaporated in the common evaporator, such as is used in making maple syrup. Indeed, I think basswood honey might even be improved by it. White-clover honey is injured, and heart's-ease ruined, by boiling. I know there is a great deal of speculation in this, but I should like to see an apiary of, say, a hundred colonies run on this plan in a first-rate locality for basswood.

JAMES A. GREEN.

Dayton, Ill., Sept. 20, 1889.

CUCKOO-BEES.

PROF. COOK GIVES US SOME TRUTH THAT IS STRANGER THAN FICTION.

ON page 34 of my Bee-keeper's Guide I thus refer to these curious insects:

"Other bees—the numerous species of the genera *Nomada* and *Apathus* are the black sheep in the family *Apidae*. These tramps, already referred to, like the English cuckoo, and American cow blackbird, steal in upon the unwary, and, though all unbidden, lay their eggs; in this way appropriating food and lodging for their own yet unborn. Thus these insect vagabonds impose upon the unsuspecting foster-mothers in these violated homes, and these same foster-mothers show by their tender care of the merciless intruders that they are miserably fooled; for they guard and care for infant bees which, with age, will in turn practice this same nefarious trickery. The *apathus* species steal into the nests of *bombus*; the *nomada* species, which are small bees, often beautifully ringed, into the nests of the small black andrena."

Now, Mr. Editor, I am wondering if I should not have said in the last sentence, the *apathus* species steal into the nests of *bombus*, and into the hives of our honey-bees. Several times this summer I have received letters from Indiana bee-keepers, complaining of the presence in their hives of black bees, often in considerable numbers. Several have written that the black bees were not honey-bees. I have written repeatedly for the bees, and now comes a box with two bees. I wish there had been ten or a dozen (or, better, 50), wrapped in cotton, so they could not have been injured; and the following letter from Mr. Perry Moore, Hortonsville, Indiana: "I send you by to-day's mail two insects that I found in a colony of bees. The bees are hybrids, and in good condition. These bees have not been without a good laying queen for more than a year. There are one hundred or more of these bees in this colony. Although I have kept bees for the past twelve years I never saw any thing like this before."

Now, Mr. Editor, this is interesting. I find this to be a species of *apathus*. It is about the size of a worker, but resembles more the bumble-bee. Like all bees of this kind—cuckoo-bees—there are no pollen-baskets. Its thieving habits make such organs unnecessary. If we, by hook or crook, get others to do our work, then we need no tools. Heretofore we had not supposed that these insect-thieves pilfered from our hive-bees; but now our suspicion is fully aroused. Note that Mr. Moore says that there are one hundred or so in the colony. Does this not look as if these bees were reared in

this hive—the brood being cared for by the honey-bees? This is very interesting practically, no less than scientifically. I have written to Mr. Moore to examine at once to see if these bees were being bred in the hive. There are two ways to find out. First, study the larvæ to see if some are different from the others. This might be a long, tedious, and difficult investigation. The other is to watch for the cuckoo-bees just as they come forth from the cells. Some such ought to be seen, and they would doubtless look much like young honey-bees, smaller and lighter colored than the older bees. I hope others will also be on the lookout for these bees. Very likely these cuckoo-bees will winter right in the hive with the other bees. To find out their habits in this respect will also be very interesting. I hope Mr. Moore and others will try to find out the truth in the matter. If I can get some of these bees I will try to see if I can introduce them here, that I may study their life-history.

Agricultural College, Mich.

A. J. Cook.

Well, well, old friend, you have indeed got hold of something, if it be true, that might well astonish the whole of us; but either you have not told us all, or else you have not considered all there is to it. Were those eggs surreptitiously placed in the worker-cells by a queen cuckoo-bee, or are the workers all queens? What enemy have we to fight—the single insect that eludes the sentinels, and lays some eggs in worker-cells, or a whole tribe of them? If the 100 or more are going to lay eggs, how long will they stay in the hive before they start out on their nefarious business? You suggest that they may stay over winter. Now, if they do, what then?

ROBBER-BEES.

AN EXPERIENCE ON A LARGE SCALE.

PREVIOUS to coming here to Cuba I had had comparatively little knowledge and little experience in this line of bee-keeping; but the past two summers have been spent in an almost constant contest with robber-bees; and possibly telling my experience may be a little help to some who, from any reason whatever, may be placed similarly to myself. Of course, the true remedy is never to handle bees so they will get started, which can always be done in our Northern States, and almost always in the South; but sometimes experiments are being made in a new country, as we are doing here, or a bad season occurs in California, such as did occur there a few years ago, when whole apiaries had to be fed to save them. In such instances the best way to control robbers is exactly what we want to know. Here where, partly from a mistaken idea and partly for experimental purposes, we are trying to keep 500 colonies in a field, which during four or five of the hottest months of the year, gives forage for not over 200 colonies, we have to practice wholesale feeding, and plenty of robber-bees is the natural result. Of course, the right way is to keep bees, here and elsewhere, so no wholesale feeding will be necessary, during ordinary seasons at least, and we now know how that can be done here in Cuba.

In June of last year I suddenly found that at least a quarter of our 430 colonies had less than a pound of honey to the colony, some of them not

over an ounce, while the other three quarters would average not over 3 lbs. each, with no arrangements for feeding on hand, or that could be procured in less than a month of time. Fortunately, for this purpose at least, our hives were of the fast-bottom-board type, and I could feed in the hives. About two-thirds of the colonies required from one to four feeds each during the summer. I had fed but a few hundred pounds of honey, when I saw that it would be impossible to feed honey that way; so we changed to sugar syrup as a food. The smell of this doesn't seem to excite the robbers so much as honey does. With this we managed to get through the season, although with great difficulty. It was the most disagreeable season's work I ever did with bees, except this summer's. Last spring we obtained 230 feeders, similar to the modified Miller feeders you make. This year we had to commence feeding by the middle of May, nearly a month earlier than last year, and have had to feed nearly three-fourths of our 500 colonies.

We have learned a number of things in connection with this work. Some of them are: 1. That what would be a very light task indeed, requiring almost no skill at all, to feed 100 or even 200 colonies, is an almost impossible task with 500 colonies. 2. That we must feed as few times as possible, therefore must feed as much at a time as the bees are certain to take up during the night. 3. That robbers are much worse around a hive which has feed left in the feeders. 4. That each time we feed, unless we wait longer between feeds than we could do, the robbers would be worse than the previous time, showing clearly how susceptible bees are to being educated, in one direction at least. 5. That honey fed in the bottom of hives attracts robbers much worse than if given in feeders on the top of combs. 6. That mild-flavored honey attracts robbers much less than does strong-flavored honey. There is no need of mentioning the old well-known facts about feeding after sundown, and about Italians protecting stores better than black bees do, etc.

I usually practice feeding from 20 to 30 colonies at a time, and give 5 or 6 pounds at a feed to each colony. The first three or four times feeding, no precautions whatever were needed—not even to contract the entrances. The next two or three times, contracting the entrances was sufficient; then it became necessary to entirely close the entrances of all the weaker colonies, which was done the last thing before retiring at night. The entrances were kept closed until after the first charge of the robbers was over in the morning, usually until nine or ten o'clock. Soon, this was not sufficient, and something else had to be done. I tried using wire-cloth covers on the hives, but that was a failure, just as you describe in your A B C book. I then obtained some strips of glass, 3 x 12 inches, and leaned them over the entrances. These were a material help, as the robbers had to travel several inches under the glass before reaching the hive entrances, thus giving the defenders a great advantage. But in time the robbers learned how to manage these. Wet grass over the entrances was of little account. About this time it looked as though I had two horns of a dilemma to choose between. One was, to allow a few score of colonies to die of starvation, or to feed and have them destroyed by robbers. Had the apiary been my own, I should have decreased the number of colonies at least a hundred last spring, instead of increasing that many, as we

did, or I should have divided what we had into two or more apiaries, thus entirely preventing this condition of things; but, whether fortunately or otherwise, time only will prove. I was, for the first time in my life, obliged to follow another's judgment of proper methods in the apiary, and to do the best I could.

The new revision of Langstroth's book helped us out of this trouble by its suggestion of the use of carbolic acid, which proved the most satisfactory of any thing I had tried, and I have so far not lost a single colony by starvation. It is used very dilute, less than a tablespoonful each of carbolic acid and glycerine in a 4 oz. bottle of water, sprayed as much as needed on a bunch of dried grass placed at the entrance to any hive robbers may be working at. It needs to be used carefully to prevent injury to the colony being robbed. By persistent watchfulness and care, and the use of every thing I could think of, I have succeeded in bringing the apiary intact through over four months of steady feeding; but it has been by far the most unpleasant work I have ever done with bees, and one I hope never to repeat.

O. O. POPPLETON.

Havana, Cuba, Sept. 14, 1889.

Thanks for the account of your experience. Some years, we are aware, are a great deal worse for robbers than others. Two years ago this summer, you will remember, perhaps, we stated in the department of Our Own Apiary that robbers were as bad as we had ever seen them, and that most of the well-known methods (to say nothing of prevention) proved a failure. At the time, we used a pane of glass. As you say, this had only a temporary effect, for the robbers soon learned the trick of going under the glass. We also used a weak solution of carbolic acid, the same being sprayed in front of the entrance, or wherever the robbers concentrated their attacks (see GLEANINGS for 1887, p. 671). For a while this seemed to work very successfully; but the strong scent of the solution seemed to disorganize the defenders of the home as well as the robbers, and in due time the latter got the advantage. They, too, got so hardened and defiant that they would go through thick and thin. We had some 300 colonies, and there was hardly a pound—yes, hardly an ounce, in their hives. The days were hot and dry, and we can appreciate somewhat your situation.

In addition to what Ernest has said in the above, I wish to add that I have had more or less experience in regard to every one of the six points you make. I wish especially to call attention to the fact that robbers will hang around a hive, and force an entrance, very much worse while there is feed in the feeders than they will after the feed has been taken down and placed in the combs. I became so well convinced of this that I was in the habit of deciding when the feed was all out of the feeder by the movements of the robbers in front of the hive. One explanation for it is this: That when bees have their attention all taken up with the contents of a large feeder they seem to forget to keep the usual sentinels around the entrance. When I fed a barrel of sugar to a single colony, in a few days they got so that they seemed to care very little whether

robbers got in or not. Honey had been poured into their hive day after day to such an extent that they could not believe but that it was plentiful everywhere. I, like yourself, soon determined that each colony must have no more than it would take up before daylight in the morning. I also discovered that basswood honey, with its strong aroma, was ever so much worse to set the apiary in a craze than any other kind. In fact, after they had once got a taste of strong basswood honey not fully ripened, during hot weather in August, it seemed as if they would bite through inch boards to get at it. They got under the door of the honey-house, found cracks between the siding, went down the chimney, and came up through the ventilator, just to get that much-coveted basswood honey. I have been where I saw just the two horns of the dilemma that you speak of; and at such a time, woe to the hive that is without queen or brood.

A LOUISIANA APIARY.

THE YUCCA GRANDEFLORA.

I MAIL you to-day a photo of a grand flower now in bloom in a part of my bee-yard. It is the yucca grandeflora. It stands ten feet in the body, capped by this immense ball of white blossoms, each as large as a teacup, and at least 500 cups to the head. The cups have been filled with bees from the opening till the present time. My severe loss, a few years ago, in the apiary, from Paris green, retarded my work very much; but I am again catching up, and have to-day 111 stands of bees in splendid condition. At one time I became very much discouraged, fearing that, if the planters had to continue the use of Paris green year after year, I might as well go out of the business; but I believe now, seeing the result of last year's experience, that it is a rare thing for the bees to visit plants to which Paris green has been applied. Last year it was used on the cotton to exterminate the cotton-worm, in the same manner and time as the preceding year, on thousands of acres in our vicinity, and yet I lost no bees last year, while the year before I saved only 33 out of 118.

I have been living in our present locality only eight years. When we first came here it was a wilderness, a Louisiana swamp; to-day I have around me one of the nicest little orchards of apples, pears, figs, and plums, in the country. The pomegranates you can see to the left of the picture. To the right of the picture is a row of basswoods which I have with great difficulty induced to grow here, having to shade them till they were three years old. To GLEANINGS I owe most of my knowledge. I have been a regular subscriber since 1878. How many older ones have you on your list? I look forward to the coming of each number now as eagerly as I did the first that were published eleven years ago.

I have had my ups and downs, like every other bee-keeper that has lived, and my "bee fever" has never cooled for an instant; nor can I hear that shrill tattoo that sounds "a swarm out" without starting with all the excitement of the first stages of the disease. Outside of the profit (and at times

they have well repaid me) I love the study, and have taught it to my three boys, who are now old enough to do the work, almost, with me.

I have always used the Langstroth hive, on Mr. Winder's pattern, which takes the Simplicity frames.

One other item I should like to mention is my experience with the Chapman honey-plant. We were sent seed from the Agricultural Dept., Washington, last year, and planted it in April. They did not bloom till this spring, and it may be that there is so much more to gather honey from while they are blooming that the bees have neglected them entirely. I shall plant again, and try another season. We extracted 60 lbs. this morning from a hive that had already yielded 75 lbs. this spring.

Monroe, La., July 20, 1889. ST. J. T. MOORE.

Your photo was received, and we should have been very glad to present it to our readers in the shape of an engraving; but some parts of the picture were so dim and out of focus that it would be impracticable to engrave it by our special process. You have given us a very good pen-picture, however.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

LARD CANS: WILL THEY BE SUITABLE FOR HONEY?

Please inform me whether round tin cans, such as lard is shipped in (holding 50 lbs. of lard), would be suitable to put extracted honey in, to be left in the honey-house for three or four months. I can get these cans for about 20 cts. each. They are as good as new, having been used only once. Do you consider them heavy enough to hold honey?

AMOS G. ADDISON.

Huntington, Fla., Sept. 10, 1889.

Any kind of tin cans are suitable for honey; but be sure you have them cleansed so that there is not any lardy smell about them. If I am correct, such cases as you mention have been used quite extensively already. You can decide only by actual test as to whether they are strong enough. They will probably need to be crated, to prevent injury in shipping, and a round can is much more inconvenient to crate than a square one. This is the principal reason why we have adopted the square can instead of the round.

BEES TOO NEAR THE HIGHWAY: SERIOUS RESULTS OF SUCH PROXIMITY.

We have had an occurrence in our county that is well calculated to set bee-keepers thinking. A bee-keeper has been keeping his bees very close to the highway, and a few days since they stung a horse to death, badly stung another one, and several people, thus causing considerable damage and annoyance. Now, there is considerable prejudice against our business, and we are not altogether blameless; for in looking over bee-yards we find a great many bees just as close to public roads as fences will allow, and are therefore a public nuisance, and dangerous as well. I hope GLEANINGS will give this matter attention, to the end that careless bee-keepers have their attention called to this matter, so that no more prejudice arise against our business.

Because we love our business is no reason to suppose our neighbor wishes to have his property damaged, or be stung himself. Move the bees back.

C. A. DEAN.

Auburn, Pa., Sept. 2, 1889.

GETTING PROPOLIS OFF FROM GLOVES.

Please tell your readers what will take propolis off rubber gloves, or how to get it off. I am sure they would like to know.

MRS. H. J. PROPER.

Franklin Corners, Pa., Sept. 19, 1889.

My good friend, we can not answer you from actual experience, for no one uses rubber gloves in our apiary, that I know of; and although we sell hundreds of dollars' worth of these gloves, it has always seemed to me that it was a mistaken notion that they were needed in handling bees. The solvent for propolis is benzine; but whether it will resolve the rubber also, can be ascertained by experiment alone.

BEE-STINGS A REMEDY FOR RHEUMATISM.

I commenced in 1887, with one stand, and now have 32. Although the season has been very poor, I have been able to get 600 lbs. extracted and 100 lbs. comb honey, most of it raspberry and white clover, so far this season. The fall flow has commenced now, and prospects are good. I think I shall be able to get more this fall than last spring. The greatest benefit received from the bees, which I hope you will give through GLEANINGS, was being cured of the rheumatism. I had the white swelling when 14 years old; and although it was cured I had been bothered ever since a great deal with rheumatism, until I commenced working with bees. I have not had a single hard spell since. I have felt several times as if I were going to have a spell; but a sting or two seemed to relieve it immediately.

C. E. LAYMAN.

Troutville Station, Va., Sept. 13, 1889.

BEE-STINGS NOT A REMEDY FOR RHEUMATISM.

I agree with Mrs. John Burr, of Braceville, Ill., that bee-stings are no relief for rheumatism. Five years ago, as I began bee-keeping I suffered from rheumatism about as badly as a man could, and I have it yet, although not so bad this summer; but last year I was disabled for six months. But as I began bee-keeping, I was told by several parties, "Now let the bees sting you as much as they have a mind to, for that will cure you." A rather bold remedy, is it not? Well, I confess I was stung enough for the entire season. My hands were swollen to double their natural size, and sometimes the face also; but it did not affect the rheumatism; but, strange as it is, since the first season, the bees may sting me ever so bad and it never swells in the least. I believe the reason for bee-stings and many other remedies recommended for rheumatism, is because it will sometimes leave a person all at once, in a change of weather or even a change of wind; then when the sufferer has been using something he is ready to say it cured him. I have been fooled many a time the same way, although I am not very apt to jump at conclusions. But I have many a time thought I had something that cured me, only to find, when the trouble returned, that it had no effect upon it at all.

JULIUS JOHANNSEN.

Port Clinton, O., Sept. 9, 1889.

You make a good point, my friend, where you mention that rheumatism and like ail-

ments are almost constantly coming and going; and the fact that they often disappear very suddenly, without any apparent cause, should lead us to be slow in deciding that it was bee-stings or any sort of medicine that produced the result.

GREAT IS TRUTH, AND WILL PREVAIL.

I inclose a clipping from the *Farm, Field, and Stockman*, of Chicago, Sept. 28. I am happy to see that there are some editors that are ready to stand by the truth in this matter, instead of gathering up the slander that has been taking the rounds of the press; and I feel that it is our duty to express our thanks to all such, as much as it is our duty to express our disgust and indignation to all such as are ready to publish lies and slander concerning our honest and reputable industry.

Bluffton, Mo., Oct. 1, 1889.

S. E. MILLER.

The idea that comb honey is ever manufactured is as absurd as it is false, and has been refuted so many times that further denial seems superfluous, and yet we occasionally see a newspaper with an article on glucose and paraffine, and the American Encyclopedia contains a rehash of the same old slander. The fools aren't all dead yet.

The tide is changed. We have now good live substantial periodicals, outside of bee-journals, that are championing the cause of bee-keepers. In the name of bee-keepers we desire to thank the *Farm, Field, and Stockman*, and we hope they will continue to use their large influence in contradicting the manufactured-comb-honey nonsense. Let bee-keepers also follow up and refute every such slander upon our good people.

ANOTHER RED-CLOVER STRAIN.

The honey season in spring was short, but we had considerable clover honey. I think I must have a "red-clover" strain too. The progeny of my first queen (a leather-colored one, and the best I ever had), about 8 colonies of Italians and hybrids, went $3\frac{1}{2}$ miles to a 20 acre field, and these same bees have stored *sweet* honey the past 8 weeks, while the rest have worked on bitterweed. Since July, the sources have seemed to be peaches and bitterweed. Goldenrod and aster are now yielding some very nice honey. There has been some swarming, but they are to-day killing drones. I extracted last week from 5 to 7 frames per colony from my best strains, weighing as many pounds per frame, leaving lower story full.

Pontotoc, Miss.

C. P. COFFIN.

You have touched upon one valuable trait of the Italians. They are much more disposed to gather *sweet* honey, as you term it, than either blacks or hybrids; and I have seen this state of affairs so many times that I think it can not be a mistake. Now, did any one ever know blacks or hybrids to gather good honey while the Italians were working on an inferior quality from weeds?

A BOCUS HONEY-BOOK.

I will send you a new method of bee-keeping which I gave \$1 for, to learn something new; but I got sold.

NELSON HANER.

Cedar Creek, Wis., Aug. 8, 1889.

With the above comes a little pamphlet of 20 pages, copyrighted by Louis Craux Mudge (pronounced *Crow Much*, we presume), published in "Appleton," no State given, 1888. Now, some of you may insist that a book of

only 20 pages may be worth a dollar, after all. Perhaps it may be, but I have never seen such a one. They are usually made up about as this book is. We will take three paragraphs for a sample.

FOUNDATION COMB.—A great many people pay out money foolishly for foundation comb, when it can be made for the mere price of the wax and at home. I know full well the artificial cells are all re-modeled, and a plain surface is the best for bees to start with. Take pure beeswax, melt and pour it in flat pans. Make it about $\frac{1}{8}$ inch thick. Cut it in squares to fit frames. Take a fine needle and thread, and sew it in frames. A few stitches will do. The bees will soon fasten the comb to suit themselves. The above will save you many a dollar.

Friend Mudge has also a bee-compound. I have not learned how much a bottle costs; but if used without his druggist's prescription he intimates that it will cost not less than \$500, for on the last page we read:

A reward of \$500 will be paid for the conviction of any one using the above without my permission.

Here is another item, in regard to extracted honey:

EXTRACTED HONEY.

Uncap the cells with a warm knife, put the comb in a sheet, hang it up in a warm room where there are no flies, and allow it to drip in a pan; stir the comb at intervals. When honey makes a person sick, boil and skim it before using. This will prevent it.

It is very fortunate that friend Mudge inserted the two last sentences; for *such* extracted honey would be quite apt to make almost anybody *sick*.

"PROLIFICKS."

I wish to say that I admire GLEANINGS, and the free-hearted manner in which you write about manners and things. I was about as much shocked when I came here from York State to see the manner the Sabbath was kept as you were in Milwaukee by the girls playing ball.

I found a swarm in the wood. "Prolificks" I call them. They are a large bee, and work on red clover. I had two swarms this spring from them. I now have 17 in all, from those two. No. 1 cast 4 swarms. The first of those 4 cast four more; one of those last four cast one swarm, and this last one sent off another—eleven in all. I never saw the like before.

Snow, Wis., Sept. 30, 1889.

GEORGE PECK.

WHY DIDN'T THE BEES TAKE THE FEED?

I undertook to feed back some of my uncapped honey about the first week in September. The bees made a rush for it, and would cluster thickly upon the combs, but would carry none of the honey into the hive. They have plenty of brood in all stages, also some uncapped honey in their hive. Why do they refuse to take the proffered feed?

Gordon, O., Sept. 9, 1889.

F. A. MYERS.

Without more particulars it is a hard matter for us to say why the bees did not carry any of the honey into their hives. If you undertook to feed when honey was coming in from the fields, of course the bees would pay little or no attention to it. We presume you put the combs in the open air, although you do not say so directly. If you set them in upper stories, very likely the bees decided the honey was well enough as it was, for it was their property already. In such cases they often refuse to move it into combs in the brood-nest below, unless only a small hole is

left open between the two stories. Even then they will not always do it. I have also seen honey of such poor quality that the bees would make a start on it and back out.

IN FAVOR OF CLIPPING, AND WHY; SEE QUESTION 138, PAGE 638.

No, we would rather lose ten queens than one swarm at the beginning of the surplus-honey season, as we lost two this year. They both came out at the same time. One had a clipped queen. The other had a young queen, unclipped. They both united and went elsewhere without even clustering, when, if both queens had been clipped, we would not have lost them. Again, a friend had a swarm come out and cluster on an old apple-tree limb, 25 feet from the ground, where no one could get; but the queen was clipped, and the swarm soon returned, and both queen and bees were saved without much trouble. PARSHALL & GROVER.

Cooperstown, N. Y., Sept. 4, 1889.

We grant all you say. I have had like experience; but we also had much trouble and vexation at other times, because our queens were clipped and could not fly.

SWEET CLOVER; FACTS WANTED.

I should like to know something definite about sweet clover as a honey-plant. I think it is the best honey-plant we have. Can some one, living where it is abundant, give us some facts in regard to it—not guess so, but facts? How much will it produce per acre? and how much will give a surplus with a given number of colonies, say 50 or 100? Sweet clover has been advocated as a honey-plant for a long time; and if it is as valuable as it appears to be, some one ought to be able to give us some valuable facts in regard to it. I have saved several bushels of the seed. I have no idea what I shall do with it. I did so because I think it is valuable as a honey-plant. I should like to sow 20 acres, and I am not certain but it will pay as well as any crop I can raise, but I do not know this. I wish I did. Who can tell me? My neighbors find fault about its growing along the roadside. I don't like to annoy my neighbors. I would rather raise it on my own land, provided I could make it pay to do so.

H. R. BOARDMAN.

East Townsend, O., Sept. 13, 1889.

It is a very hard matter to get definite facts in regard to any honey-plant. I suppose you noticed my reports of the sweet clover in the vicinity of Salt Lake City. In this case, however, no one could very well estimate the number of acres. There may have been hundreds; therefore one could not well say how much an acre would yield. I can say this, however, that they get tons of honey, of a quality equal to any thing known, allowing me to judge. Now, if you will excuse me I think you will have very great difficulty in getting a good stand on, say, 20 acres; and I am furthermore quite sure that it would not pay the cost, even if you did. Prof. Cook has just made some experiments on a large scale, in raising plants specially for honey. The State bears the expense, so he can afford it; but I am quite sure he has not made it pay. In Salt Lake City they can reclaim saleratus lots, as they call them, by getting a strong growth of sweet clover, and then plowing it under; therefore it becomes

an object with them. Possibly it does better on the saleratus or alkali soils of the desert.

SPIDER-PLANT IN ITS NATIVE HOME.

The spider-plant abounds here in great quantities. Acres and acres of it are here in the Arkansas Valley, and it grows right up to this city. It seems to me any quantity of seed could be procured here. I have no bees yet, but am bound to try them. How do you gather the seed of the spider-plant, and what is the demand for it? No mistake about it, it is the genuine spider-plant. I have grown it in Ohio, and am well acquainted with it. Lots of alfalfa clover here. I think bees ought to do well here.

Larned, Kan., Oct. 4, 1889.

A. H. DUFF.

Thanks, friend D. During my California trip I saw both spider-plant and Rocky Mountain bee-plant growing wild in different localities, though not in any great quantity. Since Samuel Wilson's extravagant puff of the Rocky Mountain bee-plant, there has been an unusual inquiry for the seed. The seed of both these plants is gathered by grasping the pods when they are ripe enough so as to begin to shell out of their own accord. Strip them into a tin pan or some similar utensil, then dry them for a few hours in the sun, when they are ready to bag up and put away. In a few days you can get a new supply, and so on. The seed continues to ripen for a period of weeks or even months, so that you can not well cut and thrash it as we do most other seeds. It can, however, be gathered out quite rapidly after one has become an expert in stripping the pods. Hold your pan under them, for many of them shell out as soon as they are touched. The seed usually retails at about 20 cts. an ounce, or \$2 a pound. It is used, however, only by bee-keepers.

GLASS-BLOWERS ON A STRIKE; A BLOCKADE ON MUTH JARS.

The glass-blowers of our factory are on a strike. Our friends were getting our order filled by another factory, whose blowers found it out, and refused to work also. I have since sent my order direct to this second factory; and if those blowers please, we shall have here 60 gross of jars by the end of this week. I am very sorry, but what shall we do about it? We have orders on hand for more than 100 gross, and shall fill them just as fast as we can do so.

CHAS. F. MUTH & SON.

Cincinnati, Sept. 18, 1889.

GALLBERRY HONEY AND ITS QUALITY.

I send you to-day by mail a small sample of honey made from the bloom of what we call "gallberry." It is a small bush, from 2 to 5 feet high, which grows profusely all over the southern part of the Gulf States, and is regarded somewhat as a nuisance, or at best a useless shrub. It has a very small white flower, which yields this kind of honey in great abundance while in bloom, which is about 20 days. With 26 hives I secured about 175 gallons of honey like the sample, which has netted me about \$1.00 per gallon, or 9 cents per lb. I send the sample to get your opinion of the honey as compared with the best Northern honey.

Moss Point, Miss., Sept. 13, 1889. M. M. EVANS.

In body and color it will compare favorably with any of the Northern honey. In

flavor it is very nearly equal to the best clover; perhaps some judges would call it fully equal. It ought to compete with any honey.

REPORTS ENCOURAGING.

FROM 4 TO 10, AND 218 LBS. OF COMB HONEY.

From four stocks I have increased to ten, and taken 218 lbs. comb honey. I believe all are in good condition to winter.

A. A. LEWIS.

Waterbury, Vt., Sept. 23, 1889.

FROM 61 TO 103, AND 7000 LBS. HONEY.

The three pecks of Japanese buckwheat did well. We sowed it on an acre and a half, and got 40 bushels. We started in the spring with 61 colonies; increased to 103, and have about 5000 comb and 2000 extracted. There was hardly any fall honey, on account of dry weather.

C. J. SCHAFER.

Eddyville, Iowa.

FROM 30 TO 73, AND 5800 LBS. OF SECTION HONEY.

My bees have done well. I had 30 colonies in the spring. I now have 73, and 5800 pounds of one-pound section honey—an average of 193¼ pounds per colony, spring count. The queen I got of you was a good one. I have some of her daughters that have made 200 pounds of one-pound section honey since they swarmed. One colony gained 19¼ pounds in one day, the 13th of June. We had plenty of rain, and the clover looks fine—better than last year at this time. Put me down as one of those lucky bee-men. Score one for the Italian bees. They are good enough for me—any way, the kind you sent me.

JOHN BLODGET.

Empire Prairie, Mo., Sept. 26, 1889.

I do not remember to have had testimony from the queens we have sold before, in just the way you put it; but it strikes me as being a sensible way—that is, some of the daughters of the queen you bought of us have produced colonies giving 200 lbs. of comb honey, after they swarmed. Nineteen and one-fourth pounds a day is tremendous. Now, please do not get the opinion that we want to boast of our stock of Italians, nor to claim that they are better than other stock; for, in fact, we have done nothing to make them better, except to make frequent importations every season, of queens direct from Italy. Of course, our agent there is instructed to give us good strong healthy queens, and no other.

REPORTS DISCOURAGING.

ALMOST THOROUGHLY DISCOURAGED.

You may discontinue my GLEANINGS, and put me in Blasted Hopes, as I had 80 colonies this spring and have not got one pound of honey. I do not think that the bees will get enough to live on this winter. I have been a subscriber to GLEANINGS for 15 years, and I suppose I shall be lost without it; but I am almost thoroughly discouraged, as there has not been a good honey year here for about six years.

JOHN BAXTER.

Crothersville, Ind., Sept. 20, 1889.

It is a little singular that you have had six consecutive bad years. Have none of your neighbors around you had good crops

of honey in all this time? One might be tempted to decide that your locality is a poor one; yet I am inclined to think, from reports, that every part of Indiana does, at least occasionally, give good honey-yields. Perhaps your very next season, after you give up the business, may be one that would have made amends for all the poor ones. If you examine our column of Reports Encouraging, you will see that great yields are occasionally reported where there has been a dearth of honey for perhaps several seasons. Before you give up, however, be sure to go around and visit your neighbors, and see whether there are not some who get good yields in spite of poor seasons. This is one of the good things about conventions. We are liable to fall into errors in thinking as well as errors in management; and a comparison with successful men will often show us where we have missed it.

OUR QUESTION-BOX.

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 146.—a. Do you propose to sell your honey on commission this year? b. If not, will you sell it by peddling or otherwise?

a. No; b. In our home market. A. J. COOK.

a. Yes, I always do when I have any.

GEO. GRIMM.

No. I have an outlet for my honey, which I prefer.

O. O. POPPLETON.

By commission, when I know the commission merchant is reliable.

P. L. VIALLO.

Yes, unless I get a chance to sell it at wholesale.

G. M. DOOLITTLE.

a. No; b. We sell to dealers for cash, and to bakers for cash. I don't do much with commission men.

E. FRANCE.

a. No. b. To the jobber or the retailer, or wherever I can get the most for it, and get the cash with the least trouble.

H. R. BOARDMAN.

a. I have not decided yet. I should prefer to sell direct to jobbers, and save commission. b. Peddling is too expensive in my locality.

A. E. MANUM.

a. I will sell in part on commission. b. I have worked up some trade in Texas and elsewhere, where I sell considerable direct to merchants.

R. WILKIN.

a. I prefer to sell for cash. b. I may have some peddled; but the only peddling I ever had done, the peddler kept all of the money but wanted more honey.

P. H. ELWOOD.

a. No, sir. b. Yes, sir; that is, mostly "otherwise." Some customers in Toledo, and our groceries here, get away with all my surplus, and sometimes more.

A. B. MASON.

We have for 20 years sold it by several methods. We ship on commission a little. We sell largely on orders. We sold a little by hiring peddlers, and we think this method very good.

DADANT & SON.

a. "Not if the court knows itself." b. If I have honey to sell in any considerable quantity, which is not a certainty yet, I will endeavor to find a home market, in various ways. MRS. L. HARRISON.

a. I prefer to sell my honey rather than to send it to commission men. I will take the best market I can find. I shipped last year to five different States before I closed out my crop of 32,000 lbs. S. I. FREEBORN.

I should always sell to him who would pay me the best price. Peddling is a business, and there are not many good honey-peddlers. But it will pay everybody to retail his goods if he can. C. F. MUTH.

a. I have not decided. b. If I should get a large yield, nothing would please me better than to sell it all in the home market by peddling, and then crow over it. Should I get a light yield, I will peddle any way, but you will not hear the crow. RAMBLER.

That depends on how much I get. If we have as large a crop as I hope for, I may be obliged to send some off to be sold on commission. I prefer to sell to dealers, keeping them constantly supplied, but with only a small stock, and never asking them for pay until they have sold the honey. I have never tried peddling, and do not think I shall. J. A. GREEN.

a. Not if I can help it. There is such a terrible long tail to the commission cat that I do not like it. I like to realize upon the results of my labor some time during the present generation, while I still have the cheerful habit of residing in this world. b. I will try to sell it out and out for cash to some responsible dealer who buys that way. JAMES HEDDON.

a. I can not say. b. I don't think I'm a born peddler, so I shall not try that, but I'll probably try to supply the groceries so far as they care to be supplied in my home market; and then it will depend on prices to be had, whether I sell in a lump to some large dealer at a distance, or send to one or more cities on commission. C. C. MILLER.

As my apiary is within an hour's drive of a large city, I have never shipped honey on commission. I do not propose to begin A. D. 1889. I take pains to encourage, and have built up a considerable custom of persons who call and buy. I think nearly every apiarist could do so if he went at it right. This is the best way, so far as it will go. Next establish regular routes and take honey to the doors of farmers and village people every six weeks or so. City people are worried by an excess of peddlers, and do not bite well. Next try the city groceries. If they will take your crop on terms satisfactory, very well; if not, as a last resort previous to sending to distant commission men, peddle in the city. E. E. HASTY.

The general impression seems to be in favor of selling honey outright, or attending to sales personally, in some way or other. I suppose one might get accustomed to the business of furnishing commission men so as to find it perhaps the easiest way of disposing of a very large crop; but the commission man should be an expert in handling honey, and the honey-producer should also be thoroughly posted, so as to be able to give the commission man reasonable directions in regard to the disposal.

Every boy or girl, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock six different books, as follows: viz.: Sheer Off, Silver Keys, The Giant-Killer; or The Roby Family, Rescued from Egypt, Pigrin's Progress, and Ten Nights in a Bar-Room. We have also Our Homes, Part I., and Our Homes, Part II. Besides the above books, you may have a photograph of our old house apiary, and a photograph of our own apiary, both taken a great many years ago. In the former is a picture of Novice, Blue Eyes, and Caddy, and a glimpse of Ernest. We have also some pretty little colored pictures of birds, fruits, flowers, etc., suitable for framing. You can have your choice of any one of the above pictures or books for every letter that gives us some valuable piece of information.

MORE ABOUT WOLVES, BEARS, AND OTHER WILD ANIMALS.

WRITTEN FOR THE JUVENILES BY UNCLE AMOS.

WHILE riding out with friend France, over the hills, we came to a point where some wonderful mounds rose clear up above the surrounding country. I called them mountains, and I feel like sticking to it still. They are really small mountains, and their height is so great that, when I started on my trip to Richland County, I could catch glimpses of them until we were twenty or thirty miles away. The railway runs out quite near one of them, and circles around it, so you can get a glimpse of it on all sides. These mounds are pretty near the center of the State of Wisconsin, if I am correct. Well, while we were riding along I kept watching the hills, rocks, and the streams, and pretty soon I told friend France that many of the rocks looked much like those in the region of Mammoth Cave, and I said I thought there must be caverns in those hills. But he declared there were no caves nor caverns, nor any thing of the sort. But I did not quite give up. Pretty soon we started to go over toward one of his apiaries. We had to go there crosslots. In the middle of a great big field my eye caught sight of a hole in the ground, as if a great big well had some time or other caved in there. Said I:

"Look here, friend France; I want you to tell me what that hole is doing out here in this lot."

"Why," said he, "that is what we call a chimney."

"But what is a chimney doing out here? Is not that the mouth of a cavern away down under the ground? When it rains does not the rain water pour right in it and go out of sight?"

He admitted that it did, but he did not believe there was any cave. My friend, if you ever see the water, after a rain, pouring into a hole in the ground, and disappearing, you may be sure there is a cavern down there; and if it were anywhere in my vi-

cinity I would dig down and see where the water went to, and may be have a cave or cavern of my own. He finally acknowledged that there were places in their vicinity where the water poured into these chimney-holes and came out on the banks of a river half a mile away. He said he knew it was the same water, on account of the color of the soil that washed into the hole and then came out as stated. Well, this made the study of Grant County of very much more interest to me during my whole visit. I wonder how many of my juvenile friends read what I said about the "machinery of the universe."

I told you about friend France's museum, where he had all sorts of wild animals stuffed, and fixed up so they looked exactly like life. He has for many years been a great wolf-hunter; and the funny part about it is, that, when he hunts wolves, he does not have any gun or dogs, nor even a pistol or a bowie-knife. When the wolves are killing sheep, and the folks can not catch the wolves, they send for friend France. He just starts off by himself, peeking about here and there with those sharp eyes of his, noticing a thousand things that you and I would never have noticed at all, and by and by he gets the wolf, *and the cubs too*. Perhaps most of you have heard the story of General Putnam, who crawled into the den of a fierce, bloodthirsty wolf, grabbed it by the ears, while his friends pulled him out with a rope attached to his feet. Friend France said, that, to one who is acquainted with the habits and nature of the wolf, this was no wonderful thing at all. He said he had crawled into wolves' dens, and got them out, over and over again. Years ago there was an old she-wolf that made a terrible havoc among the sheep in the vicinity of that very mound (or mountain), which to me was an unceasing wonder as it raised its head against the eastern sky. He tracked the wolf up into a den, or sort of cave, on the north side of the mound, where the hill is so steep that nobody can climb it. He hired a man to go with him, and they approached the cave just at nightfall. This cave was formed by a large rock resting against the mountain-side; and as a good deal of dirt had settled down under it, the crevice where the wolves crawled in and out was hardly large enough for a man of the size of friend France. So he took along a hoe, and dug the dirt away so he could get in. As it was so near night they decided to lie down and keep watch until morning. They judged that the old she-wolf was outside, because, during the hours of the night, they could hear a constant cat-like tread, or stepping, on the leaves and twigs above and below the entrance. Before very long his companion got frightened by the howling of the wolves, and went away, leaving friend France alone.

"But, didn't you keep up a big fire to keep the wolves away?"

"Fire!" ejaculated he; "what did I want of fire?"

"Why, so the wolves would not eat you up."

"Well, I reckon they would have had

tough chewing if they had set out on that job."

Morning finally came, and with his hoe he proceeded to make the cave big enough so he could get in. Then he plugged it up with a stone so the mother-wolf would not get in behind and bother him, and then he went for the cubs. After considerable digging he got hold of them; and, taking one under each arm, he carefully backed out; then he went back for another; but, probably getting a little elated at the pile of money he was going to get for their scalps, he made a little too much haste and bumped the head of one of the cubs against a projecting rock. At this the little chap set up a piteous whine; and you can imagine his consternation on hearing the deep, fierce, angry growl from the mother, who was not outside after all, but right there back of her cubs. Now, during all this time he had not so much as a match in his pocket. He crawled out with his cubs, however, laid them down by the others, put some matches in his pocket, and, armed with a spear which he sometimes took along for such emergencies, he went back into the den. When he got where he expected the war to begin, he scratched a match. As its feeble blaze lighted up the gloom within, the first object which he beheld was the mother-wolf, with open mouth, and eyes glaring like coals of fire. He thought first of pushing the spear right into her mouth; but experience had shown that this was not the best way. He had time, by the fitful glimmer, only to lower his spear toward the region of her heart, when she made an angry spring, so fierce that, when she struck the point of the spear, it threw him, spear and all, over back until the back end of the spear struck on a projecting rock, driving the blade clear through her body. He trudged home, not only with the scalp of the mother, but, if I recollect aright, four or five cubs. He says nothing is to be feared from wolves unless they come in great droves. They are sneaking, cowardly, and afraid even to look a courageous man in the eye. If they can sneak around behind so as to grab one's coat-tails they may venture an attack in that way when very hungry.

On going home late one night he was admonished by a friend to take a dog along, as it was certainly unsafe. It was in the winter time, and very soon he could see the wolves dodging behind him. The dog became frightened, and ran for his life. For several miles, two wolves kept so close to him that they actually snapped their teeth at his coat-tails; but he said, that, so long as there were only two of them, he let them snap all they wished to, thinking he could stand it if they could. When they got through the woods into the clearing, they skulked off.

At another time he was employed to catch a she-wolf with several young ones. The young ones were too small to be afraid, and in a little while he had taken their scalps and buried the bodies. His employers, however, complained bitterly because he caught the cubs and let the mother go, insinuating that this was a game of the wolf-hunters, to

leave the mother to furnish more cubs, so that the hunters could get the bounty for a new litter year after year. Friend France, however, told them to be patient, and have a little more charity, assuring them that he would have the mother in less than 24 hours. Sure enough, when night shrouded her from gaze she tracked them to the place where her darlings were buried, and commenced to dig them up, proposing, doubtless, to carry them home and give them a decent burial according to the customs and traditions of wolf fathers and mothers; but, alas! while she was showing her devotion to the last remains of her loved ones, friend France captured her also. This is one of their tricks for getting the mother after they have captured her cubs.

Now, little friends, if you want any more wolf-stories, you must ask our big friend Mr. France to tell them himself. Uncle Amos is now ready to give you some bear-stories.

Among other things that Prof. Cook said I must see before we went away, was their pet bear; and the pet bear at the Agricultural College is no exception to bears in general, in the matter of his love for honey. They do not let him take the honey out of the hives as the California and Wisconsin bears do; but when they want him to show off before visitors they just give him a bottle full. I walked down to the place where he is kept tied to a tree. He seemed quite glad to see me, putting up his nose in a very sociable manner, and licking my hand, and blinking at me in quite a knowing way with his queer little eyes. I did not discover the secret of his being glad to meet visitors, and scrape acquaintance, until I saw Charlie coming with a Muth jar holding nearly a pint of honey. The bear began at once making all sorts of expressions of approval, and reaching out for the honey; but as the programme was to take his picture with the Kodak while he "drank" the honey, I told Charlie that he must, if possible, get the bear to come out under the full blaze of the morning sun. According, Charlie unfastened the chain from the hickory-tree, and pulled him along in order to get him to climb over a pile of boards so as to get over the top of the picket fence. The bear came along quite cheerfully, keeping an eye on the bottle of honey. I was pleased to see the dexterity with which he climbed over the pickets, so as to avoid being pricked by their sharp points. Before he got out into the sunshine, however, he began to set up quite a whine, much like an urchin crying for a piece of gingerbread. As soon as he got the bottle between his paws, he stuck his long tongue away down into the honey; and, oh what a smacking there was! When he had licked out the honey as far as his tongue would go, he began to whine in real distress. But Prof. Cook bade me have my instrument ready, and just wait. Pretty soon it popped into the bear's head, that, if he could not coax the honey up to his mouth, he would have to put his mouth lowermost, so the honey would run into it. With a kind of grunt of satisfaction to think that he remembered how it was done,

he straightened himself up as you see in the picture.

BEAR TAKING HONEY OUT OF A MUTH JAR.

As he smacked his lips he tipped the bottle a little too fast; and it not only ran down into his mouth, but some of it ran over his eyes. That was of small consequence, however. He blinked with his eyes to get the honey off, while he smacked his lips and looked happy. Long after every drop was drained from the bottle, he kept poking his tongue around the inside and then outside, along his furry cheeks, and as near his eyes as his tongue would reach. Then he gave a purr of satisfaction. By the way, I forgot to mention that bears purr a good deal as cats do. When I first met him and patted him on the head he commenced purring right away, as much as to say, "Why, of course we are glad to see Uncle Amos here, as well as the rest of the folks."

Now, I do not know how many bottles of honey his bearship could take at one meal. A pint bottle full did not seem to go a great way; and as it must be quite a little tax on the good friends at the Agricultural College, I do not know but we ought to pass the hat around, to help Prof. Cook bear the expense. His bearship ought really to attend our next National Convention. He could sample honey, any way.

Well, the sun was rising higher up. It would soon be train time, and there were more things to see yet. So Charlie picked up the chain, and told the bear he must go back. By the way, Charlie is a son of Prof. Cook's brother (who lives on the farm), and a nice boy he is. The bear, however, cast many lingering looks at the empty bottle, and with some reluctance started back for his inclosure. We were all in a hurry; and just as Charlie gave him a yank to make him step quicker, as he climbed over the pickets again, his appearance was so irresistibly comical that I snapped the Kodak on him once more.

He was whining softly to himself because he could not have any more honey. In the meantime Charlie was tugging the bear's

chain until its collar had slipped around, pulling the fur the wrong way, and tipping one ear forward in a most comical sort of way; at the same time the honey had not

HIS BEARSHIP CLIMBING A PICKET FENCE.

ceased dripping from his eyelids. Meanwhile one of his hind feet was clawing in vain to secure a foothold on the smooth pickets. Finally he got on to a strip of board and got over. He did not say good-by as I started off with the Kodak; but his comical look, and his mischievous-looking countenance, were "better than a circus," as the boys sometimes say.

Now, little friends, I hope you as well as Uncle Amos know a little more about bears and wolves than you once did; and while we defend ourselves from their savage nature and warlike claws, let us remember that they are God's creatures, and, in one sense, our neighbors.

OFF TO THE OIL (?) WELLS.

AUNT KATIE TAKES US OFF TO ANOTHER PICNIC IN CALIFORNIA.

AS you all seemed to enjoy the trip we took up to Zaca Lake, suppose you go with us to-day to the oil-wells near Port Harford. They are 70 miles away, so we will go on the excursion train that runs there and back for one dollar. Ernest is calling, "Come, mamma, are you not ready yet?"

"I will take the lunch-basket: and, Lewis, you start with the baby, while mamma picks up the odds and ends, and fastens the doors."

"As mamma has got everything done that she can do until you all get out of the house, away you go, and we will follow," says papa.

"Hurry up, or you will be late," is the last we hear from the youngsters as they rush out of sight, headed for the depot. We shall get there in plenty of time, so we will walk slow and get over the hubbub, and enjoy this lovely morning air. I especially appreciate the slow walk, for I have been pretty busy ever since 6 A. M., and it is now 8; and then,

again, a walk in the morning is rather a novelty in my busy life.

Well, here we are at the depot, and we shall have to amuse ourselves by looking at the people coming for 40 minutes yet. But that soon passes, as we greet this one and that as they come up to the platform.

Toot! toot! sounds the engine, and up it comes, gliding gracefully by, and stopping quietly just beyond the platform. In we all get, and soon we start, not with the jerk, jerk, that used to be so trying, but smoothly we go, gaining in speed until the highest speed these narrow-gauge tracks will allow is attained. Soon we get to a station, and slacken up for a moment to give the station agent time to signal stop or go on. We stop, as a couple of young fellows wish to go with us. Then on we go, rattling over bridges. Oh! bless me, isn't it pleasant riding on the rails? At nearly all the stations and depots, some one or more join our party. The young folks keep up a constant chatter, while we of more sedate and maturer years listen, and smile at their sallies, without the trouble of thought. We just rest and enjoy. Soon San Luis looms up in sight; and when we stop, many get off the train and more get on, so that, as we glide down the cañon that leads to the sea, where Port Harford is, we are quite crowded; but good order prevails, and we keep a sharp lookout for familiar landmarks. Here we go, past the Catholic burying-ground, then a bare rocky hillside seems to glide past, then the large and handsomely arranged Protestant cemetery appears. Then on, on, until "Oil Wells!" is shouted. About half the people start; and when the train stops, off we get. Baby's wraps and lunch-baskets are distributed, and we cross the little bridges, walk under those grand old oaks and sycamores, and in three minutes we arrive at the bath-house.

"What! bath-houses?" says one; "do you bathe in oil?"

We laugh, having forgotten that all our party did not know it was hot sulphur water we came to see, and not oil.

"No, we do not bathe in oil; but do you see that water pouring out of that six-inch pipe, up on that platform?"

"Yes."

"Well, the company of men who owned this tract of 100 acres thought that there was every indication of oil. You see, the mountain back of the well is coal and slate formation. Well, they decided to bore for oil, so they got an artesian-well outfit, and commenced boring. When they got down about 400 feet they struck this hot sulphur water. They shut it off, although it was a very strong stream, and bored 500 feet more, but found nothing but the hot sulphur water. So, as there are no warm baths near here they decided to let the water run, and they built that long bath-house, that plunge-bath house, and the large hotel you see over there, and then got the cars to stop and let passengers off at their path, and now the place goes by the name of Oil Wells. It is well patronized, especially on excursion days, which occur about every two weeks."

The boys have rushed off to explore every place, and to speak for a chance in the plunge. No bathtubs for them, but we speak for a tub and get it. The water is just the right warmth to be delightful. The baby thinks it a little hot, but gives only one or two grunts, and then proceeds to paddle and splash

with the greatest delight. Oh, the delicious rest and comfort we get from that bath! We are all as red as beets when we finally emerge from the rooms. Now, be careful and not sit or stand where the cool ocean wind will blow upon you. Here is a handsome pavilion. We will spread our lunch and take our ease in its shelter, before we ramble about. The boys gobble down (they do not eat) their share of the lunch, and that is the last we see of them till about train time. We eat and rest, and then wander up to the hotel, to look for friends. We are surprised at finding that we are well acquainted with the landlady and two or three of the guests, being old acquaintances. We pass a pleasant hour on the broad veranda, looking at the charming natural view, and watching the picnic parties, campers, and the constant going and coming of vehicles loaded with live freight. There is no loud talk or rough manners; all seem quietly happy.

It is about train time. Get the things ready, for we must leave this sylvan retreat, and hie away home again, taking with us a pleasant memory of a day pleasantly spent. Puff, puff, whiz, here's the train. We all scramble on; and just as day is fading we arrive at home. AUNT KATIE HILTON.

Los Alamos, Cal.

TRYING TO RAISE POP-CORN.

I planted some pop-corn. It did not do very well. Two years ago I had a piece, and the musk-rats helped me harvest it. I think if I keep trying I may have a good crop some time. I have a colt two years old, named Pedro. I am saving money to buy a saddle. I have a lamb. Its mother is dead. MORRISON J. McCLAUGHRY, age 10.

Salem, N. Y., Sept. 5, 1889.

TOBACCO A REMEDY FOR ROBBING.

Father has 26 stands of bees. While I believe as you do about tobacco, we had one case in our apiary where tobacco was a help to us. Pa opened a hive of bees when they were not getting much honey, and the other bees got to robbing them, and they got so mad that we could not go near them. Pa put some rotten wood in the smoker and smoked the robbers with it, but it would do no good. So ma put some tobacco in the smoker and went behind the hive and smoked them with it, and it quieted them in a little while. EDITH STAHL.

Rochester, Ky., Sept. 2, 1889.

A QUEEN THAT LIVED 5 YEARS.

In one of the back numbers of GLEANINGS you say it is a rare thing for a queen to live 4 years. We have one that we are certain was 5, and might have been 6 or 7 for all we know. She was an Italian, and we found her in a tree. My brother Stanley was stung this spring, and in a few minutes he was all over blotches. He breathed with difficulty, as if he had the croup. We were very much alarmed, but pa gave him brandy, and he soon recovered. Pa wintered his bees in the cellar, and they came through all right. ETHEL EDWARDS.

Ingersoll, Ont., Can., June 3, 1889.

THE FLORIDA SCORPION.

As I don't know much about bees that is not generally known, I will tell you something about the Florida scorpion. This scorpion is about an inch and a quarter long, grayish colored; has six legs, and a tail as long as its body. Its tail is jointed,

and has two little sharp hooks on the end. When it is angry it flirts its tail over its back and sticks these hooks into whatever it holds in its fore feet. Its sting is poisonous, and hurts a good deal, but never kills any one. We have found a good many in our house, in the bedrooms and kitchen. They like to get among blankets and clothing. Florida people learn to shake their clothes well before putting them on. I don't like Florida as well as Pennsylvania. DON C. BAIRD.

Orlando, Fla., Sept. 5, 1889.

ABOUT A QUEEN THAT STOPPED TO VISIT WITH A LITTLE GIRL.

Last spring we took five gallons of honey that the bees had gathered from wild flowers; but in June papa bought some buckwheat for the bees, and they gathered a good portion of honey from that. We took the upper story off, that they might store the honey away for winter food. We fed our bees last winter on sugar syrup. Papa takes GLEANINGS, and we always welcome its coming, with much pleasure.

One morning I was in the yard looking at the hives, and was ready to go into the house, when a queen came through the air and alighted on my arm. I caught her very gently, so as to show her to mamma; then I held her up on my hand, and she flew off to one of the hives. MAMIE BEDFORD.

Fayette, Wis., Sept. 27, 1889.

THE PECAN-TREE.

I promised to tell about pecans. The pecan-tree is large, like a walnut. Its leaves are like walnut. The pecan blooms in April, and the nuts get ripe in October and November. It begins to bear at the age of five to fifteen. The age of the pecan is unknown. Trees are found four and five feet through. At the age of fifteen it is not more than ten inches through. The nut of the pecan is in a hull, like the walnut, only much thinner, and it is divided into four parts. As the pecan gets ripe, the hull cracks open and lets the pecan drop. From one pecan up to six grow in a bunch. It is a pretty sight to see them growing in that manner. Some people wait till the pecans drop off the trees, to gather them. Sometimes they knock them down with a club. But the best way is to climb a tree with a long pole and knock them down with it, and pick them up. Sometimes the pecans hang on the trees until March. A 49-pound flour-sack holds a bushel, just even. There are 42 pounds in a bushel. Pecans sell for \$1.50 to \$3.50 per bushel.

Belton, Texas.

WM. MORGAN.

We are glad to know about the pecans. They have frequently been sent us from the South, and we have sometimes succeeded in selling them to a limited extent. I had already judged, by the appearance and taste of the nut, that they were something like our shellbark hickory-nuts. I do not quite like the idea, however, of clubbing nut-bearing trees with poles. Does it not injure the future usefulness of the tree? It seems to me that nuts of all kinds are much nicer if we wait till old dame Nature shells them out and lets them drop of her own accord. If, however, they hang on as you intimate, perhaps a gentle bumping might be in order, as a suggestion to the tree that it was time for her to shell out and drop her treasures.

A RUINED LIFE.

A SAD BUT TRUE STORY.

“O you know what has become of Alice B—, or do you ever hear any thing about her any more?”

“No,” was the reply; “I have not heard of her for a long time; but the last time I heard, she was in California. Her parents are living next door to me, and I see them quite frequently; but she has been such a source of grief to them that I never mention her name in their presence any more. She quite broke their hearts.”

Hearing the above conversation as it passed between two elderly ladies of my acquaintance, and having seen the person they were speaking of, and knowing something of the latter part of her career, I felt somewhat curious to know more of her early life. Hence I embraced this opportunity of making some inquiries of one who knew the whole sad story. Here it is in brief, and from one who had been her friend:

Alice B— was a very pretty girl, and when quite young was married to Mr. W—, with a fair prospect of a happy life. But she was exceedingly fond of admiration and gay society, and it was not long before she began to neglect husband and home for other society and gayer scenes. Only a few years of such a life—for they were years of misery and unhappiness—and then her husband left her, and she went home to her father's house, taking her two little children with her. Leaving them there, she went to another town and soon obtained a divorce.

About that time she became acquainted with a widower, a very respectable man, nearly twice her age, and possessed of considerable property. After a very brief courtship they were married, and went to reside in the vicinity of her former home. For a time all seemed to be going on quietly and happily; and for the sake of her friends as much as for her own, she was received in the best circles, and her past life ignored.

But, alas! a quiet life did not satisfy her; and her love of admiration, and her flirtations, became so notorious that people shook their heads, looked askance, and began to shun her. Friends talked with her, urging her to live a different life, but without avail.

One day, when in the midst of a gay company, she received a message summoning her home. Her husband had met with an accident, been seriously injured, and was thought to be dying. He was unconscious, and, after lingering in great agony for two days, death came to his relief. In the two years of their married life a little boy had come to their home; but the father had scarcely been laid to rest ere the little one sickened, and he, too, passed away. For a few months the mother seemed very penitent, and almost crushed by her great sorrow. Then the charms of the old life returned, and, seeming to forget every thing else, she went from bad to worse, and, becoming infatuated with a married man of bad repute, eloped with him and went west. She had left all for him; but he soon tired of her and deserted her, leaving her a stranger in a strange land.

What a wretched ending to what might have been a happy life! Can you imagine any cause for

such a ruined life? Let me tell you what her old father said:

“Alice was ruined by reading novels! We knew she was fond of reading, but we did not know the character of the literature in which she indulged until it was too late, and the mischief was done. She had spent much of her time poring over sensational novels—books filled with descriptions of flirtations, jealousy, and divorce—until her whole being became imbued with the poison, and she lived the characters over again in her own life. Her mind was poisoned, and so filled with ‘blood-and-thunder’ stories that every good impulse seemed destroyed.”

“Yes, Alice was ruined by reading *trashy, sensational books and papers.*”

How many lives have been wrecked and saddened in this subtle way! Dear reader, does not this story contain a warning? Should not parents, and others who have young people in their care, consider it as much of a duty to feed the minds of the young with good, pure literature, as to feed the bodies with healthful food? The mind *must* have food, just as certainly as the body; and if it does not find healthful food, it generally finds plenty of a poor character. In these days, when so much good literature can be obtained for a small sum of money, is it not a duty to make provision for the home? Children crave something more than the Bible and Bible stories; and though these should always have a prominent place, if something more is not furnished them they will be sure to find it for themselves. Will it be “Broken Hearts,” and such trash, or something good and helpful, stimulating them to live good, pure lives?

Ipava, Ills.

ANNA B. QUILLIN.

My good friend, there are many and many cases like the one you mention, where lives have been ruined by reading trashy, sensational novels and papers. When in my teens I was greatly given to such reading myself; and the memory of the false impressions and false teaching that I then received will haunt me till death. Had I not been turned squarely about by giving my heart to Christ Jesus, there is no knowing where I might have been by this time; and I think now that the very best safeguard for any one is a complete surrender to Him whose spirit was “not to minister unto, but to minister.” Sometimes, during late years I have been foolish enough to waste a little time in reading something that has no point or moral to it; and I always feel guilty and ashamed of myself afterward. Perhaps many will think it too strict, but I do believe that great good would follow if it were a custom for every child in his teens to submit to his father or mother every book before reading it. The careful and prayerful parent can in five minutes determine whether the book be a profitable one or not. I would first turn to the introduction, to see what the author has to say, or what reasons he has to give for writing a book. Then I would read perhaps half a page in the middle, and may be as much at the close. Five minutes is enough to decide whether the book is for or against righteousness. If it has nothing to say either way, I would reject it. “He that is not for me is against me.” Many of us are in the habit of keep-

ing a careful, sharp eye about our gardens and our bee-hives, to see whether an enemy be lurking. My friend, it is a thousand times more important that you keep a sharp eye about the house, to see what kinds of books and papers are being brought in; and especially is this keen scrutiny needed in a family of many children. I would not deprive these little minds of books and papers; but whenever one book is taken away, or sent home, or back to the library, bring three or four good ones to occupy its place. Books and papers are cheap and plentiful; but do not admit them solely because they are cheap. Our stenographer just now asks for a list of good books. In the way of fiction, I know of nothing better in English print than Pansy's entire series. And, to cut the matter short, I would recommend the Sunday school library in any of our established churches. I can not remember that I have ever read one (and I have read a good many purposely to decide whether they were fit mental food for our children) without feeling that it had brought me nearer to Christ Jesus.

NOTES OF TRAVEL.

SOMETHING ABOUT ARTIFICIAL HONEY-COMB.

MY last visit among the bee-keepers was at Bell Branch, near Detroit, where friend M. H. Hunt hails from. The picture of Mr. Hunt's pretty apiary will be found on page 625 of our issue for Aug. 1. The picture, however, does not do justice at all. The hives are located in groups under large branching apple-trees. The trees are trimmed so as to be out of the way of one's head when working among the hives. By the way, when wearing a bee-veil you can not afford to have brush or limbs of trees catching on to your veil, tearing it or pulling it off from your face. If you do not fix things conveniently for rapid and uninterrupted work, when you get a big honey-crop you will be sorry.

Friend H. has two children—a boy and a girl. The girl is about the age of Blue Eyes; and as Blue Eyes was with me on my return trip, they two very soon became quite sociable. I think it is no more than fair to state that friend Hunt is one of our "gilt-edged" business men. Nobody ever has to ask him for money when he is owing; and, in fact, I do not believe we have ever sent him even a statement by way of reminder. He is also so prompt, careful, and accurate in filling orders that I can not remember of having ever received so much as a breath of complaint against him.

The horse-power, which we described and illustrated, which he first used for hive-making, has been laid aside, and a neat little steam-engine takes its place. I believe, however, he buys most of his hives and sections from larger manufacturers, using his engine only for filling special orders, and for making odd-sized hives, or to fill out some order that is wanted in a great hurry. He has a nice stock of lumber, accurately planed at a planing-mill, piled up ready for

emergencies; and with his help and his machinery he can very quickly supply any thing unusual or in immediate want. Near his factory is a buckwheat field, so uniform and of such wonderful luxuriance that I snapped the Kodak on it once or twice; but it did not work up so as to be worthy of a place in print. Friend Hunt is only eight miles from Detroit, therefore he has ample facilities for getting lumber at low prices, or any thing else he may need for the supply business; but as he is three or four miles from a railroad station, he contemplates moving up nearer by.

One inducement to call on friend Hunt was the promise that he would go with me to visit the Eureka Supply Co., in Detroit. This company is arranging to manufacture artificial honey-comb, under friend Weed's patent. This has been frequently mentioned in years past, friend Weed having, some time ago, an advertisement in GLEANINGS, of small pieces of artificial honey-comb. This was while he was located in Cincinnati. We were very kindly received, and even hospitably treated. We saw the machinery for making the comb, and it was all very kindly explained. By a powerful hydraulic press, cakes of wax, warmed to just the right temperature, are forced through proper dies, so as to form cells of honey-comb, not only deep enough for worker-bees, but two or three feet deep, if you choose. In fact, a great big stick, or log, of cells of honey-comb, reminded me very much of a split chestnut fence-post, the cells looking like the pores of the wood, only being ever so much larger. Now, in order to make honey-comb, all you have to do is to cut off a slice $\frac{1}{8}$ inch thick. The slices are cut off like cutting slices from a loaf of bread. Of course, this is not honey-comb, because the cells have no bottom half way through, and here is the great problem—how shall we make a bottom to this honey-comb? I suggested at once that sheets of comb, with holes clear through, be given the bees, and let them see what they can do with it.* I was surprised to learn, however, that the Weed brothers had never tried it. I agreed to make the test in less than a week if they would send me a piece; but it has not come yet.

Just a word about slicing off the comb. How do you suppose they do it—saw it off? Not much, where the cell-walls are about as thin as natural comb. Cut it off with a knife? Not much better. The only thing is a hot wire. But the melted beeswax cools the wire off so quickly that nothing but an electric current can supply the heat fast enough; and accordingly they had just put in expensive electrical machinery, and an incandescent platinum wire capable of melting off slices big enough to fill a Langstroth frame. May be you would like to know how the die is made that produces the cells. As it is fully secured by patents, I obtained permission to describe it. Even if

* If the bees will fill comb with cells reaching clear through, when extracting we shall need to uncap only one side. Then comes the question, Will the bees fill the comb again, having access to only one side?

you saw the machinery, and looked at it with a magnifying-glass, you would scarcely understand it without explanation. In the first place, the wax is forced through a perforated plate. It then comes out in strings like so many worms, if you will excuse the illustration. Well, these strings are obliged to pass under an enormous pressure between a series of hexagonal plates screwed fast to the perforated plate. Suppose you had a lot of six-sided buttons, placed with such mechanical exactness that the wax that oozed up between them should be as thin as honey-comb. These tubes of wax would then rise up, as they do in fact, making a "log of wood" composed of six-sided cells. Will this machine ever enable them to get the \$1000 by manufacturing for sale artificial comb honey? Never. Even if they could get a bottom to the cells, it could not be capped over so as to imitate nature. Any bungler could tell the difference, just as any bungler could tell artificial strawberries from nature's make. The invention, however, may give us frames of comb more accurate than the bees ever produced, and possibly cheaper than the bees can make them. Our friends have been at work at it, however, a good many years, and have, during the past season, offered for sale pieces large enough to fill a section of honey; but the price will not as yet permit it to come into general use among bee-keepers.

I feel greatly indebted to the members of the Eureka Supply Co. for the information they gave me in regard to the present status of electrical science. They very kindly took me through the electric-light establishments in Detroit, and gave me an insight into the machinery and workings of the science that will make me feel under obligations to them for a good while.

OUR HOMES.

But now they desire a better country, that is, a heavenly: wherefore God is not ashamed to be called their God; for he hath prepared for them a city.—HEB. 11: 16.

Not to be ministered unto, but to minister.—MATTHEW 20: 28.

AS soon as I started on my homeward trip from Wisconsin I unconsciously began humming the familiar hymn that commences:

"One sweetly solemn thought."

I do not know what brought it to mind, but it seemed to me all at once as if I had never appreciated the wonderful thought embodied in the hymn,—

"I'm nearer home to-day than I have been before."

I believe that a great part of the world feel a dread of death. Many feel sad to think they are growing old. How is it with you, my friend? Have gray hairs and wrinkles terrors for you? Do you feel sad to think that the springtime of buoyant youth is slipping and passing? As your eyesight fails, and you begin to need spectacles, does it bring a thought of dread that your sight may fail altogether? Hearing

will very likely become impaired also. Your steps will begin to grow feeble, and may be rheumatic pains have already begun to make you twinge. Robert Ingersoll has given perhaps the most vivid picture I have seen drawn of death, as a dark, dismal abyss. From his standpoint of view, there was not one ray of light—nothing at all to make one joyous, but, rather, the utter extinguishing of every thing beautiful and bright. May God be praised, it is not so with the Christian. In the language I have quoted from, it is "Nearer my Father's house," where "burdens are laid down." When I am doing my duty I often feel not only joyous but buoyant at the thought of going home. Gray hairs that have come while in the Master's service have no terrors for me. My eyesight has failed greatly during the past summer. Unless the light is very strong, I am entirely unable to read fine print without glasses. Were it not for the invention of spectacles it would be a sad, very sad, cross to bear; but with the aid of even those that are furnished for an almost insignificant price, I can see just as well as I ever did. May the Lord be praised for the invention of spectacles! But suppose my eyes keep on failing until even specs do no good—what then? Never mind, dear friend. The resources are not limited with Him whom I serve; and he has said that not one good thing shall be withheld from those who fear him. Since I have been following him, no good thing *has* been withheld, and a remedy has been provided for every ill that life has brought. When I can read no more (if that time shall ever come), I am sure that Christ Jesus will help me to be useful in some way or other. Now, it would be wrong to be in a hurry to get through with life's duties and cares; but it is *not* wrong to rejoice at the thought of that home "where many mansions be."

I enjoyed my trips exceedingly, both to Wisconsin and California; but for all that, there came a pleasant thrill when I thought of my home and the loved ones who would be glad to see me. In the same way I have been thinking of that heavenly home—that "better country" spoken of in the language of our text. Before death comes, very likely I shall have grievous pains, and may be sore crosses to bear; and sometimes when I think of how others are called upon to suffer, I tremble for fear I may not have the grace and fortitude to bear suffering as they do. But then, again, comes the promise, "Lo, I am with you always, even to the end of the world." Perhaps some of you may say, "Now, look here, brother Root, we don't want you to be making calculations about that 'heavenly home,' for many a long year. There is work that we want you to do. Had you not better be planning to do it 'while it is day, for the night cometh when no man can work'?"

You are right, my good friend; and the suggestion just brings me to the second text. You see I have two of them for my talk to-day. What would God have us do while we are *waiting*? Why, the second text answers the question—"Not to be ministered unto, but to *minister*." If we want to be

happy and buoyant and rejoicing always, let us follow the text, as did even our Lord and Master; for he came "not to be ministered unto, but to minister, and to give his life a ransom for many."

In many avocations and pursuits of life, we are crowded. Sometimes the house you live in is too small. Sometimes the young folks, when they get married, start to live with father and mother; and with the love of Christ Jesus in the heart of even one side of the house, there will never be any feeling of being crowded. Yet the feeling sometimes comes, however. The young folks want to have more room and more liberty. A good many of the friends complain because so many pitch right into any line of business when it begins to be a little profitable. Somebody makes a pretty good thing of raising strawberries. Then everybody else in the neighborhood goes to raising them until they hardly bring enough to pay the pickers. There is a constant crowd. Somebody starts a drygoods store in a little town. Pretty soon another one starts up on the opposite corner. There is not business for both of them. It is overdone. So with the drug-store and the printing-business; so with the hotel-keeper. Why, I have even heard such things whispered about the *bee-journals*. GLEANINGS IN BEE CULTURE has done tolerably well; and others start bee-journals, thinking that they may also do tolerably well. By and by the old trouble comes up—there are *too many* bee-journals—the field is overworked. I did not say so, my friend; but it is what the *world* says. We occasionally meet people who have tried strawberries, honey-raising, dry goods, drugs, hotel-keeping, and may be they have started a bee-journal. All of them fail, because there was not a chance anywhere for a man to turn an honest penny. Sharpers and the tricky ones get all the money, so they say. Sometimes they indulge in bitter flings toward the middlemen, who "toil not, neither do they spin." They do not wait for their heavenly Father to feed them—at least so the world says—but get a pretty good feed by cheating *right and left*. Now, please remember, friends, that I have not said this. I do not believe it. The middlemen are my friends, and I love them. I hope I should love them, even if they *were* all enemies; but I am glad they are not. The world has also a way of talking about the "bloated aristocrat." It pains me to hear this term, because it is a hateful one. Well, I have made quite an array of truths, have I not? I have not spoken of *strikes and trusts*, but I might have done so. Is there a remedy? Why, Heaven bless you, my friend, to be sure there is; and the remedy is this last text of mine. I wish it were painted on a great big shingle, and tacked up at all the street corners—yes, in letters so big that they could be put up above the tops of the highest trees or meeting-house steeples. Why, since I think of it, I do not know but that it would be more needed above the steeples than over the trees. I should like to see it across the sky—"Not to be ministered unto, but to minister." Now, please do not turn away, dear friend.

There is room for all the world under the banner of this text. There is plenty of employment, with *good pay* to be had, right along in this line. The business will not be overdone for a thousand years. No, it will *never* be overdone. Thousands and thousands may enter into it, and yet there will be elbow-room—plenty of room for more—"Not to be ministered unto, but to minister." The sad part of it is, that human nature unregenerated is continually clamoring for servants to wait on them; and if the servants would work without pay, all the better. Christ Jesus stands almost alone in this grand, glorious, loving work of helping people—helping everybody, being glad because you can help—being a servant. The world clamors for fat salaries and not much hard work. The servant of Christ wants only a chance to *serve* somebody. He does not trouble himself about the pay, whether it be big or little. Why, bless your heart, dear brother and sister, he does not need to, for the Lord of all—the Judge of all the earth—takes care of the pay. He has said, in a thousand ways, that we need not worry; and he is the best paymaster on earth—more prompt and liberal than any man who ever lived. There is only a little condition; and that condition is, that we "seek first the kingdom of God, and his righteousness," and the reward is promised that "*all things* shall be added unto you." It is true. I know it is true; for every thing around me emphasizes the truth of it. Now, when I started out, perhaps you did not see that my two texts had any connection with each other. Do you see it now, dear friends? If we love to minister to those around us—to these brothers and sisters, shall we not go through life rejoicing, and singing the little hymn that gladdened my heart and made me joyous as I approached my home?

One sweetly solemn thought
Comes to me o'er and o'er;
I'm nearer home to-day, to-day,
Than I have been before.

CHORUS.

Nearer my home, nearer my home,
Nearer my home to-day, to-day,
Than I have been before.

Nearer my Father's house,
Where many mansions be;
Nearer the great white throne to-day,
Nearer the crystal sea.

Nearer the bound of life,
Where burdens are laid down;
Nearer to leave the cross to-day,
And nearer to the crown.

Be near me when my feet
Are slipping o'er the brink;
For I am nearer home to-day,
Perhaps, than now I think.

Would you like an illustration or two of the way I understand this text? A few days ago, a man with a very heavy load, in driving on to the hayscales, got one of the wheels between the platform and the bordering timbers. The enormous weight had squeezed the wheel down so that the load would apparently have to be removed before it could be extricated. He stood with a troubled look on his face, for he was doubtless in a hurry.

"My friend," said I, "don't throw your load off. We have four or five powerful jackscrews in the blacksmith-shop, and with them you can raise the wheel out of there in a twinkling, load and all."

Well, he looked happy; but I think I enjoyed it more than he did. I was exceedingly busy that day, and some of my own work had to be neglected for a few minutes. At another time a teamster would have broken his wagon on the railroad track had I not stopped to shove a board under the wheel, and extricate it from its dangerous predicament. I then explained to him the matter, and told him I had seen many good wheels broken down by attempting to cross a railroad track at an angle. A man was rolling a heavy barrel of honey from the depot platform on to his wagon. The wagon-bed was frail, and the great weight would assuredly have smashed it down at once, breaking the wagon, and may be breaking a limb of the driver. I ran rapidly, and called to him just in time. A bit of board set up endwise under the weak point made it safe. Now, accidents are occurring almost daily because people often learn only by experience about these things. Some days I tire myself out, and perhaps neglect my own work, in teaching the younger ones how to avoid accidents—how to get along safely and easily with their work—may be how to prevent catching cold, when a chilly October afternoon comes after these beautiful sunshiny days. Sometimes I can get in a word for Christ Jesus; and if it seems to be well received, such *ministering* makes me happier than *any thing* else. When night comes I am very tired, and may be the printers scold because they have not had the copy they needed. But I am happy, nevertheless. And may be if I had written the copy without doing the *ministering*, I should not have been able to give you something really helpful. And as I close I feel like thanking the dear Savior because he has given me a helpful message to deliver to you to-day. I am sure the message will be helpful, for it is builded on the solid rock of Christ's promises—not to be *ministered unto*, but to minister.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

WHAT SHALL WE PLANT IN THE MIDDLE OF OCTOBER?

WELL, friends, we can not plant very much, unless it is rye or spinach, or winter-onion sets, or something of that nature. We can, however, start gardening almost as well as in spring, if we have hot-beds, cold-frames, or green-houses. During October and November, we can grow a great many things without fire heat or even the heat of manure. The simple protection of sash will give results equal to March and April. Lettuce, radishes, and other things may be matured under sash, without any heat. Tomatoes, lima beans, and a host of other things that are not consumed before frost, may be sim-

ply laid on the ground, attached to the vines under sash, and they will ripen up nicely. Even though we can not plant outdoors, there is lots of work that we can do. We have some beautiful celery that was transplanted in very rich ground Oct. 1. As we have had abundant rains, it is now making a very beautiful growth. The plants were, however, very strong, and each one was taken up with a ball of earth. It is now, Oct. 10, ready to bank. I merely mention this to show you what may be done with vacant ground where it is very rich. Ours was where we dug a lot of very fine Rural Blush potatoes. Another thing: Even if it is not advisable to set out strawberries later, you can fix the ground all ready for them in the spring. That is just what we are doing this beautiful Indian-summer afternoon. The boys are gathering the bush lima beans, and pulling up the tomatoes, while the big team is drawing manure and covering the ground as thick as it can be plowed under nicely. We are going to fit it exactly as I described on page 721. Just as soon as the ground thaws in the spring, the plants will be put in with transplanting-tubes. We could put them in this fall without any trouble, provided they were mulched heavily. But it will probably be cheaper to fix the ground now, and then let the plants stand in the matted row where they are, until spring.

THE IGNOTUM TOMATO.

We have received testimonials enough in praise of this tomato to make a startling pamphlet. Below is one of them:

I received from you a packet of Ignotum tomato seed, containing just 20 seeds. Nineteen seeds germinated. One plant was accidentally broken off. They were transplanted in open ground, directly from the greenhouse, May 23d, the same day that I transplanted Dwarf Champions from the cold-frame, and the first ripe tomatoes were picked from Ignotum. One plant of Ignotum turned out to be a tree-tomato, and another set such rough fruit that I pulled it out, so I had left but 16 plants. From these I picked about half a bushel of tomatoes *per plant*, and from that amount I have saved 28 ounces of seed. Half a bushel of tomatoes to the plant, when planted 6 ft. x 5, is a yield of 650 bushel per acre. Pretty large, I think.

F. S. McCLELLAND.

New Brighton, Pa., Oct. 7, 1889.

The above not only gives the good points, but some of the bad ones. It is true, that some of the plants produce bad-shaped fruit; but by selecting seeds persistently from one of the best, I think we shall correct the tendency. On our grounds but very few plants this season produced any thing different from the regular type. I admit that the tomato is not perfect in every respect. There are other tomatoes of better shape; but no tomato, so far as I know, has as many desirable points. I have offered our friend \$7.00 for his 28 ounces of seed, so you see there was more to my little present of tomato seeds than any of us thought of at the time. The little gift has given quite a number of the friends several dollars—in one case \$15.00 or \$16.00; and I feel glad

over it, exactly as I have tried to describe to you in the Home Papers for this issue.

CATCHING DESTRUCTIVE MOTHS BY BURNING A LAMP IN A TUB OF WATER AT NIGHT—SEE PAGE 790.

Prof. Cook replies to the matter as below:

The cut-worm moths and the cabbage plusia could be caught by a light over a tub of water; but the remedy is hardly practical, as the moths fly at night, and the time varies, so no one would be on the lookout, and ready. The worst pests, the cabbage-butterfly larvæ, fly by day, and would not be killed at all. Bubach (California pyrethrum) kills all, is cheap, easy to apply, and practical.

Agricultural College, Mich. A. J. COOK.

GETTING SEEDS OF SPIDER-PLANTS AND ROCKY MOUNTAIN PLANTS TO GERMINATE.

Looking over Sept. 1st GLEANINGS, page 709, comments on *Aeneas Walker*, you say you can't make the spider-plant seed start in the greenhouses and hot-beds. The Bible teaches you your religion, and why don't you let nature teach you her laws? Have your gardener mix a quart of seed in a bushel of dirt, in a box. Let it freeze till wanted; then thaw it, and sow where wanted in the house or beds, and you will wish it in some other place. To some one who could not start any, I gave a pint of dirt from where they grew two years ago, to scatter in the plant-pot; and on inquiring about it he said he had more plants than he wanted. H. L. JEFFREY.

New Milford, Conn., Sept. 11, 1889.

HOW TO MAKE AND KEEP SOUR-KRAUT—INFORMATION WANTED.

Can't you give an article on making and keeping of sour-kraut? I have more or less difficulty in getting the stuff to keep. It spoils before half the winter is past. Some of my neighbors say, to keep sour-kraut I must freeze it solid during a cold snap; others say it is spoiled after being frozen. How is this? Another thing I should like to ask: Have you tried the Crandall currant, sent out by Frank Ford & Son? If it is as good as the introducers claim it to be, I must try it, even if a single bush costs more than a dozen of White Grape currants.

W. G. BRAINARD.

Gouverneur, N. Y., Sept. 27, 1889.

We have had a good deal the same trouble you mention. When we put our sour-kraut in clean crocks, however—say crocks holding toward a quarter of a barrel—we had no trouble. Perhaps some of our readers can help us a little.—We have Ford's Crandall currant on our place. It has fruited this year; but the berries are very few in number (although the bush is large and strong, being two years old), small in size, none of them being much larger than our largest cherry-currants; and last, but not least, we did not find them very good. Another thing that troubled me, the bush and fruit look almost exactly like an ornamental flowering currant bought some years ago of Storrs & Harrison, Painesville, O. I notice, however, that our neighbors, Ford & Son, write to one of our periodicals on gardening that the bushes seldom bear profusely until they are several years old; and, if I am correct, the yield of fruit does not seem to be uniform on different bushes.

Ours was on very rich ground, and has made a very rank growth. Perhaps it will do better when it gets older. Let us not be in haste to condemn new things.

HOW TO TELL WHEN WATERMELONS ARE RIPE.

I see in GLEANINGS for September 15 that Mr. M. L. Benedict, of Crete, Neb., wishes some one to tell how to know a ripe watermelon by sight; and as I consider myself an expert at this I will try to do so. My first crop was in 1874, when I had two acres of melons, weighing from 20 to 60 lbs., that lay so close together that a man could have walked in any direction and stepped only on melons. I then knew of no way of telling a ripe melon but by thumping, so I thumped till I wore the nails off all my fingers to the "quick," and was compelled to stop that method. I then had recourse to sight; and, either from instructions from others or my own observations, I have found the following indications good in the order named:

1. There grows on the vine at the joint, where the stem of the melon joins it, a tendril. When this dies it indicates ripeness.

2. There also grows at the same point a little rounded leaf that we call the "ear." When this dies, it more certainly indicates ripeness.

3. Turn the melon up and notice if any change has taken place in the shade of the part next to the ground. A slight yellowness indicates ripeness.

4. The upper surface becomes a little rusty, and changes its shade a little, just a little, about the difference there is between milk that has "set" and that which is fresh, when the melon ripens.

This is the indication upon which I mostly rely; and so expert have I become in its use that I can go into a field with three or four assistants and point out ripe melons faster than they can pull them. I can also tell pretty closely the degree of ripeness, so as to be able to pull them a day or two before they are ripe, and get them to market at just the right time.

Of course, there are variations, such as difference in varieties, soils, seasons, climate, and diseases of the vine, that experience alone can make us understand.

W. H. GREER.

Paris, Tenn., Sept. 23, 1889.

Thanks, friend G. I think you are about correct in the matter.

THE JESSIE STRAWBERRY, AND ITS ADAPTABILITY TO GREENHOUSE CULTURE, ETC.

The Experiment Station, Columbus, O., in their July report, state as follows:

JESSIE—(perfect). The present season is the first in which the Jessie has not been entirely satisfactory here. It seemed to be less vigorous and less fruitful than in former seasons. It is much more fruitful than Cumberland and Sharpless, but less so than Bubach. It takes first rank in appearance and quality of fruit, hence is valuable for amateurs and those who grow for home use only. As a market variety it is not without value, and is especially useful to plant with pistillate sorts. Mr. Farnsworth says: "Jessie is not a success with us—not productive enough." It proved to be the best for forcing of any variety tested, maturing quite as fine berries under glass as out of doors.

The last sentence is quite an interesting one to us here: for while we have not much ambition to produce strawberries in the winter time, if we can, by the use of sash in the spring, get them a few weeks earlier, it may

open a business that will compete successfully with that of shipping berries from the South.

Here is something from a friend, right in a line with the above:

A runner blossomed the last of August. In September, toward the last, it bore about eight or ten good-sized berries. Perhaps you can start some fall berries. Who knows, in these times?

WM. C. HOLMES.

Amity, Dekalb Co., Mo., Sept. 27, 1889.

This reminds me that our friend Dan White, of New London, Ohio, who raises strawberries on a considerable scale, as well as honey, informed me a short time ago that he had several runners that put forth blossoms, and bore fruit in the fall. Now, will our experiment stations or somebody else tell us what is necessary to make the Jessie do so every time? Who knows but that we can have strawberries here in the fall months as well as in California and Oregon?

TESTING NEW VARIETIES OF STRAWBERRIES AS THEY COME UP.

A word in regard to new strawberries in general. The *Rural New-Yorker* people say they have been for years testing every new variety that made its appearance. Some seasons the new berries that claimed wonderful things amounted to even 50 or 75; but after years of patient testing they have not a whole dozen worthy of being retained. The probability is, that this work must still be repeated for years to come. The strawberries recommended ten years ago, that are still under cultivation, are very few.

GLEANINGS IN BEE CULTURE.

Published Semi-Monthly.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, OHIO.

TERMS: \$1.00 PER YEAR, POSTPAID.

For Clubbing Rates, See First Page of Reading Matter.

MEDINA, OCT. 15, 1889.

As the earth bringeth forth her bud, and as the garden causeth the things that are sown in it to spring forth, so the Lord God will cause righteousness and praise to spring forth before all the nations.—ISA. 61:11.

THE OREGON EVERBEARING STRAWBERRY.

A GOOD many of the friends have complained of the way in which the advertiser of these plants has used them. By the way, I will explain that our friend Seth Winquist is a boy of only 20 years of age; and when our friends learn that, I believe they will have a little more charity. You remember, that, when he first sent out the advertisement, I suggested that the price was too low. Our young friend soon found it out. Most of us, however, would have filled orders, even at a considerable loss, until another advertisement could appear, correcting the price. Our young friend, however, thinking it always fair and honorable to return the money, chose the latter plan; but so many orders were sent him that he was obliged to have printed circulars, pay

all postage, and do all the corresponding, for nothing. It was unfortunate for him to put the price so low to start with; but very likely as he grows in years he will also grow in judgment and wisdom. I think we can excuse him, can we not, even if his large advance in price does savor somewhat of speculation?

ANOTHER BEE-BOOK FROM GERMANY.

WE have just received from C. A. Schwetschke & Son, of Brunswick, Germany, a book devoted entirely to apicultural carpentry. The pages are 10 x 7, printed on fine calendered paper. This first number of the whole work contains 38 pictures of hives and out-apiaries and honey-houses. First we have, for instance, a most superb cut of the entire house or hive, as the case may be, and then a front sectional view, a side sectional view, and then the ground plan. The cuts show every piece used in the construction of the house, and its exact length, breadth, and thickness; in fact, the cuts give a better idea of the construction of the buildings than a personal inspection could possibly do. The typography of the book is of the very highest rank, and the entire work only increases our admiration for the scrupulous care and artistic eye of our German friends. All bee-keepers who can read German will find this work of great value, even in the construction of honey-houses of different shape from those represented. The work sells at 25 cts. a number, which is remarkably cheap. It is printed where Gravenhorst's book was, in Brunswick.

TOO MANY REMEDIES FOR FOUL BROOD.

THERE are remedies for foul brood almost without number. One claims that coffee is a sure cure; another that coal oil is the remedy; still another besmears his affected combs with a solution of sulphur, and he avers, that, since then, he has had no more trouble. The truth is, that, just as soon as Brown finds out that there is something irregular with the brood in one of his hives, he jumps at the conclusion that he must have foul brood. He straightway daubs the combs with a mixture of his own "get up." Eureka! it's a success! He must needs go and publish it in some bee-journal. Of course, he did not stop to consider whether the little irregularity in the brood would have got well any way; much less, whether he had the real disease in the first place. There may be some reason in using a remedy that is a well-known antiseptic or a germicide; but when a foul-brood mixture is neither, and has no science nor even common sense to back it, it is the height of folly for you to fuss with it. It is well enough for scientists to experiment with a remedy; but a bee-keeper who owns a hundred or even a less number of colonies can not afford to risk his whole apiary. Don't try any thing else than the starvation plan, or, in isolated cases, complete extermination. These are *sure*.

The above was written by Ernest. I heartily indorse it; and I should say that the same system of reasoning should be applied to remedies for diseases that afflict the human family.

GIVING IT TO THE EDITORS.

ONE of our subscribers, Mr. J. M. Harris, seeing the comb-honey business maligned in the usual way in the shape of a clipping from Harper's *Bazar*, in his own paper, the *Cedartown Standard*, after showing the impossibility of the thing, called upon the editor, and the result of it was that Mr. Harris

wrote an article refuting it. After showing the impossibility of the thing, he winds up as follows:

My friends, do you believe such a thing can be done? "Well, Mr. Bazar said so, and we have no right to dispute it." But that is not the question. Do you believe such a thing can be done? "Well, we may not believe it, still we are not responsible for a sentiment copied from another paper." If you were called into court to testify, you would not be allowed to repeat the sayings of others, but would be required to tell what you know about it. Now, my friends, what do you know about artificial honey-comb filled with artificial (glucose or sugar syrup) honey?

Mr. A. I. Root, of Medina, Ohio, offered \$1000 four or five years ago for proof of artificial comb honey. Not taken yet.

Now, what I am trying to do is to show you that I think you are not justifiable in repeating what others have testified against a neighbor unless you have some grounds for believing the assertion is true. There are some people who try to make an honest living, and it matters not what their business is, if it is honorable.

If apiculture is not an honorable calling, but is made a pretense of to defraud the public, then it should be suppressed. On the other hand, if it is right for a man to keep bees for the purpose of producing a beautiful, nutritious, and healthy food, I think the man engaged in it should not be accused of being a fraud, without evidence to prove the fact.

J. M. HARRIS.

Good, friend H.! Let others go and do likewise, if they have a county paper in their midst that has published the usual slander.

NORTHWESTERN BEE-KEEPERS' CONVENTION.

I HAVE just returned from a two-days' session of the above convention in Chicago, just as we go to press. The attendance was quite good, and we had an exceedingly pleasant and profitable time, further particulars of which will appear in next issue.

BEAUTIFUL OCTOBER.

I HARDLY know why it is, but October of late years is getting to have wonderful charms for me. Some have said, that, inasmuch as it heralds decay and death to a large part of the vegetable world, it is a dismal month; but not so to me. May be it is because of the spirit of that little hymn I have referred to elsewhere—"Nearer my home." And I rather think, too, that it is because of the thought that centers in the little text, "Not to be ministered unto, but to minister." We have just had a copious rain. The sun is now shining brightly, and the rich mellow earth over the plant-beds is just in trim to dig and rake up fine; and the thought of getting outdoors and making things grow during these October days fairly makes my heart bound; and sometimes I feel like shouting for joy and praise. I do not know but I should feel ashamed of myself a little, to think that a man within a few days of being fifty years old should be feeling as buoyant as a schoolboy; and it may be all the effect of that little text about ministering and being a servant. And then the glorious thought that comes with the consciousness of whom I am striving to serve! It is not only a glorious thing to be a "king's daughter," but it is a grand and glorious thing to be a king's son; because, you know, the son is always expected to work (*minister*) a little *harder* than the daughter.

THE CANADIAN HONEY-PRODUCER NOT DISCONTINUED.

ON page 809 we intimated in our letter to Dr. Mason that the *Canadian Honey-Producer* had been discontinued. This is a mistake; but I should not have stated this in public had I not supposed that the same had already been published in the *Bee-hive*;

but a careful search through its files shows that I was mistaken—that what I had in mind was the discontinuance of the *Queen-Breeder's Journal*. I regret this very much. I have received from Sect. Holtermann the following, which is no more than right that it should be published at this time:

BROTHER ROOT: I do not like the idea of a change at this late date. For example, I write for several agricultural papers, and have drawn attention to the meeting in Brantford, and it is difficult to get every one notified of the change. Personally I should prefer Buffalo; but whether at this date the best interests of the association will be subserved by changing, I am inclined to doubt.

R. F. HOLTERMANN.

Romney, Ont., Oct. 12.

WHERE SHALL THE NEXT NATIONAL CONVENTION BE HELD? A WORD FROM ONE OF THE EDITORS OF THE CANADIAN BEE JOURNAL.

SINCE our article on page 809 of the present issue was in type, we have received the following from Mr. F. H. Macpherson, which will explain itself:

FRIEND ROOT:—I was surprised, when I received the advance proof you were kind enough to forward, to learn that the change of the place of holding the coming International was being talked of, and that the item which I penned for the *Canadian Bee Journal* of Sept. 18 was being taken as a basis. Please take notice, that the item referred to suggested Buffalo as the place of holding the International for 1890—not for the one just upon us. I do not know whether it has been understood in this way or not; but if the article be read through to the end, there should be no mistake.

I must say that I am opposed to making any change at this late date. Dozens of Canadians have arranged to be at Brantford, who will not go to Buffalo, especially those from the eastern counties. The building in which the meeting is to be held is spoken for, and railroad rates are about settled, while all the other necessary arrangements are completed.

Again, the majority of the local Ontario associations have appointed delegates, and these—not over-affluent societies—have doubtless counted well the cost of sending their delegates, while an extra expense of \$3.00 or \$4.00 will probably be the means of keeping them at home. Then, too, the Ontario Bee-keepers' Association at its last meeting passed a resolution calling a special general meeting at Brantford at the same time as the International, and the president, vice-president, and directors (15 in all) were appointed delegates.

As to the membership, Dr. Mason suggests that it is none of our business where the meeting is held. By "our" I mean all Canadians, outside of D. A. Jones and K. F. Holtermann. It is a well-known fact that the great bulk of the membership each year comes from the vicinity where the annual meeting is held, and Canada will not be behind in this respect. As proof of my statement, take the Detroit convention: 68 out of 103 members were from Michigan, Ohio, and Ontario. If the association is international, surely Canadians have a right to an occasional meeting. But the greatest reason of all is, that the suggestion comes too late in the day. I trust that my writing will not be taken as presumption, as I am not a member, but hope to be.

F. H. MACPHERSON.

Boston, Ont., Oct. 10, 1889.

Well, now, friend M., may be I have put my foot in it. If so, I shall try to draw it out as gracefully as possible. Let's see: It seems to me that your original editorial is a little ambiguous, or, rather, it conveys pretty directly the impression I got from it. After mentioning the fact that you had invited your American friends to be present at Brantford, you insert a "by the way" clause, which seems to be somewhat of an after-thought to the preceding. The clause in question, and the one which gave me the impression that you desired to change to Buffalo for 1889, reads as follows: "By the way, would it not be mere justice to place the holding of the *next* convention at Buffalo?" The underscored word is mine. Now, the question hinges on the little word *next*. I can not get any other meaning from it than that you meant the *coming* convention, for the close of this year, 1889. I do not see how the *next* convention could refer to the year 1890, when there is yet a convention to be held in between now and then. The reasons you give for holding it at Brantford are good; but would not these delegates be willing to pay just a little more for the sake of the privilege of seeing the Falls in winter? and is it not a fact that some of the delegates are nearer Buffalo than Brantford? and would not the general expense be thereby somewhat equalized? I am still in favor of Buffalo, though I am quite willing to accede to the wishes of the majority of the members. As Prof. Cook says, we all desire the best good for the society.

A Four-Color Label for Only 75 Cts. Per Thousand!

Just think of it! we can furnish you a very neat four-color label, with your name and address, with the choice of having either "comb" or "extracted" before the word "honey," for only 75 cts. per thousand; 50 cts. per 500, or 30 cts. for 250, postpaid. The size of the label is 2½ x 1 inch—just right to go round the neck of a bottle, to put on a section, or to adorn the front of a honey-tumbler. Send for our special label catalogue for samples of this and many other pretty designs in label work.

A. I. ROOT, Medina, Ohio.

HONEY COLUMN.

CITY MARKETS.

CINCINNATI.—*Honey.*—There is a quiet but steady market for choice white comb honey at 14@16 in the jobbing way. Demand is fair from consumers and manufacturers for extracted honey. It brings 5@8 on arrival. *Beeswax* is steady, and in good demand at 20@22 on arrival, for good to choice yellow.

CHAS. F. MUTH & SON,
Cincinnati, Ohio.

Oct. 21.

ALBANY.—*Honey.*—Honey market easier under freer receipts, but we have no overstock as yet, and receipts in good shape and order sell well. Small-sized combs unglassed take the preference. 1-lb. white, 14@16; 2-lb. white, 13@14; mixed, 12@13; 1-lb. buckwheat, 12@12½, 2-lb. 11@11½. Extracted, dark, 6; light, 7½@8½.

H. R. WRIGHT,
Albany, N. Y.

Oct. 11.

BOSTON.—*Honey.*—Our honey market is in fairly good condition, but we are getting a little surplus of odd marks from Western New York, Michigan, and Wisconsin, and it is not arriving in very good condition and is very hard to sell. We quote fancy 1-lb. combs at 16@17; fair at 14@15; 2-lb. combs at 15@16. Extracted at 8@9. No beeswax on hand.

Oct. 21.

BLAKE & RIPLEY,
Boston, Mass.

COLUMBUS.—*Honey.*—Our market is in about the same condition as at last report. Only a strictly first-class article meets with any sale at 14@15.

EARLE CLICKENGER,
Columbus, Ohio.

Oct. 21.

ST. LOUIS.—*Honey.*—No change to note since our last. *Beeswax.*—Prime beeswax, 22.

D. G. TUTT GRO. CO.,
St. Louis, Mo.

Oct. 21.

DETROIT.—*Honey.*—The supply of comb honey is fully up to the demand, and selling quite freely at 13@15. Extracted, 8@9 in a small way. *Beeswax.*—23@24.

Oct. 22.

M. H. HUNT,
Bell Branch, Mich.

FOR SALE.—60 lbs. A No. 1 orange-bloom honey in square cans, \$5.00; 8 c per lb. in barrels of 360 lbs. Samples sent on application.

MODEL B. HIVE CO., W. Phila.

FOR SALE.—2000 1-lb. sections, 14 in case. *Every section* I guarantee strictly "gilt-edge." No finer honey can be produced. 15c per lb. Choice extracted, 50-lb. buckets, 7½c; 60-lb. screw-cap cans, 8c, f. o. b.

H. L. GRAHAM, Letts, Ia.

FOR SALE.—2000 lbs. of nice heartsease honey, in 1-lb. sections, 24 lb. cases, delivered free on board cars at Dixon, in good order, at 11½c per lb. This is nice honey, of good flavor and fair color.

E. BAER, Dixon, Lee Co., Ill.

FOR SALE.—I have a quantity of choice clover honey in scant 1-lb. sections, and 12-lb. cases, at 15c per lb. (100 lbs. or more). Also 60-lb. screw-cap cans of extracted clover honey at \$4.90 per can; 2 cans in 1 box, \$9.60. Safe arrival guaranteed by freight.

OLIVER FOSTER, Mt. Vernon, Linn Co., Iowa.
17tfdb

FOR SALE.—I have 2000 lbs. of No. 1 white-clover extracted honey. Will crate and put on cars at 9 cts. per lb. in 2-gal. tin cans or waxed barrel.

GEORGE BRIGGS, New Sharon, Ia.

FOR SALE.—I still have about 4000 lbs. choice extracted white-clover honey. I have also about as much nice Spanish-needle honey which, I consider as fine as the best goldenrod. Write me for price list.

EMIL J. BAXTER, Nauvoo, Han. Co., Ill.

OUT-APIARIES, NO. XVIII.

HARVESTING.

WHEN extracting at an out-apiary it would be very convenient to have a house in which to extract, as you have been used to doing, perhaps, at home. Very likely, however, you will conclude that the inconvenience to the people will be more than the convenience to you. In a good season you may find little difficulty in extracting in the open air. But if you are not an old hand at the business, I warn you to be very careful about getting the bees to robbing. If a single bee gets a load from one of your combs you are likely to get into trouble. Have robber-cloths, and keep every thing you can covered up. If to-day you get along all right, with no appearance of robbing, try it the same way next time, only be sure to set your extractor in a different place, for in the interim some bees may have had a taste of the drippings that you left in the old place, and will be on the lookout for more. Have plenty of water, and keep every thing clean. Remember it's only when bees are busy gathering, that you can extract in the open air, and sometimes they gather only in the forenoon. Possibly it may not be wise for you to attempt extracting at all, without cover, unless you are a very careful person; and, no matter how careful you are, it is only sometimes that you can be safe to operate outdoors. At all other times you can use a tent, even if you do feel cramped for room. Perhaps you think I lay more stress on the danger of robbing than I should. I hardly think so, for it is even more important at out-apiaries than at home. At home, if the bees get to robbing when you are nearly through work in the afternoon, you can stop and finish the job the next morning; but you can't work that way when you are running several apiaries. Besides, it's worse to start robbing where other people live.

In harvesting comb honey at an out-apiary, allow me to suggest that it is quite important that you should be careful not to get robbing started, especially toward the close of the season. Oftentimes you will do well to manage quite differently from the home plan. It may be you find several supers of sections (remember, when I say super it may contain wide frames or what not), ready to come off just before you are through your day's work, and you are quite anxious to take them home with you. Give the super a heavy smoking before taking it off the hive, so as to drive down all the young bees; then after the super is taken off, one hand can make a steady application of smoke while the other plies the brush. Another way is this: After taking the super from the hive, having given it the smoking first spoken of, put it on the top of another super that is to be taken off, say on No. 21. In the same way you can pile them on No. 21 till it is as high or higher than your head, so you must get something to stand on to get at the upper one. When all are piled up in this way, load your smoker for business and play away on the top without a moment's cessation, driving the smoke down into every opening, and after a little while an assistant can take off this upper super with not a bee in it. But the smoker must keep at work while this super is being taken off, playing away on the one next under it, which has already been strongly affected by the smoke driven through the upper one; and by the time the assistant has disposed of the upper super, the next will be ready to come off, and so on. When you get down to the last one that is to be taken off, the bees will probably not all leave it so readily; and if you have another pile ready to take off, it may be best to put this last super on the next pile. Instead of putting the pile on a hive you may think best to start it on the ground. Usually, however, it is best to make these piles on hives and leave them till the next day you come. Then in the

morning drive down the bees tolerably clean, make a pile of supers on the ground, a hive-cover or something of the sort under them, and put on top of the pile one of the little tents already described in GLEANINGS.

DR. MILLER'S ARRANGEMENT FOR GETTING BEES OUT OF SUPERS.

Make as many of these piles as the number of your little tents will allow; for the higher the pile, the slower your bees will be in getting out. Go through the apiary and take off all that are ready, and put them in piles under the little tents, and by the time you are ready to go in the afternoon all will be clear. If any supers are taken off so late in the day that there is not time enough for the bees to get out, put them in piles on hives, and take them off the first thing when you go next time. Look out not to start the bees to robbing when putting your load on the wagon. If the bottom of your wagon-box is not bee-tight, lay cloths or newspapers on it, so no bee can get up from below, and keep every thing on the wagon covered up all the while with robber-cloths, tarpaulin, buffalo robe, or something of the kind. If, in spite of all your precaution, the bees are pretty thick about the wagon, after the load is on, draw it some distance by hand, hitch on with a jerk, and start.

Marengo, Ill.

C. C. MILLER.

No, doctor, you do not lay a bit too much stress on this matter of robbing. It is almost the only thing I am afraid of when I see new hands start in bee-keeping. Getting stung themselves, and learning some bitter lessons from sad experience, is a small matter comparatively, when we think of annoying the whole neighborhood. Again and again have I heard people declare they hate bees, and do not want to get within a mile of them, simply because somebody had left some honey around, or had left a hive open. Of course, the great outside world do not stop to reflect that the special annoyance may be only temporary. They take it for granted that bees are always vicious, and that their sole delight is

in inflicting pain on everybody around, without sense or reason.—There, doctor, there is another thing you did not show me when I made my visit. I did not see one of those little bee-tents.

DOORYARDS FOR THE BEES.

FRIEND BOARDMAN GIVES US SOME SENSIBLE HINTS IN THE MATTER.

“**E**D, get a shovel and come here, and I'll tell you about a job I've been thinking of this morning.”

The creaking of the foot-power grindstone about a minute later told that Ed had anticipated the nature of the work I had been thinking about, and was sharpening the shovel ready to begin.

“All ready! Well, now, I have been thinking about making some nice dooryards for the bees, in front of each hive, by removing the turf, or surface dirt, a little, just enough to make a smooth hard surface, and get below the grass roots so it will not grow again this season. About two feet square, I think, will be about right. There are a great many bees, in returning from the fields, that fall short in their flight, and drop down in the backyard in front of their hives, and sometimes at a considerable distance from home, and they depend upon walking in somewhat as A. I. Root does sometimes on his return from a bee-keepers' convention, when he fails to make connection, and gets dropped out five or ten miles from the Home of the Honey-bees.

“The number that fall short in their homeward flights is much greater during a honey-flow where they come home heavily laden. It is then, too, that their time is most valuable. Of course, the time of an individual bee is very insignificant. It would not balance the scales one way or the other in the weight of a large honey crop, which is, after all, made up entirely of little tiny drops brought in by individual bees. I have often watched them when falling down in this way in the grass, and have seen them struggle and scramble along over the innumerable obstructions in their way. Even though the grass is short and smooth, they spend a great deal of time, and make very slow progress. This kind of work looks like very poor economy for the bee-keeper, and it is.”

Now, Mr. Editor, when you get left a few miles from home, with business pressing, and you are anxious to get home with as little delay as possible, and decide to push on with the power nature has provided you with, does the kind of roads you have before you make any difference with you? I dare say it is the very first thing you think of. “How is the road?” more than probable you inquire. Now, suppose, instead of a smooth even road, you were dropped in some dismal swamp or jungle or windfall that you had to scramble through the whole distance. You would then be in much the same plight as is the tired bee that falls in the grass.

“There, now, Ed, that looks about right. I think I shall like that. I have tried almost every plan I could think of to keep the space in front of the hives in shape to accommodate the little fellows. I have not yet been quite satisfied with any of the plans I have tried. I have cut the grass, scalded it with hot water, salted it, have put ashes and vari-

ous other things upon it to keep it down. I have used sawdust about the hives; I have even strewn salt lightly over the yard to induce the cow and horse to feed it down, which they very soon learned to do at night, when the bees would not molest them. This plan, as simple as it may seem, has much to recommend it when it is convenient to practice it. It is worthy of a trial. Don't think your hives will be all upset. Your cow or horse will learn to be as careful about the hives as any one doing the same work. I have had sheep turned in to one of my out-apiaries at different times for several years. They are the most reckless of any animals I have ever tried among the hives, even more so than hogs. A sheep seems never satisfied to keep away from the bees. The hog needs only one lesson.

"Now, Ed, I'll go over to the office and get the mail. I shall not be gone long, as I am interested in the work just begun in the bee-yard.

"Why, this isn't going to be a very long job. You have got 2, 4, 6, 8, 9, 10, 11, done already. How much better that will be for the bees that fall in front of the hive than grass! How nice it would be to have the yard peeled all over just that way! Just wait a moment. I am half decided to have you make a clean job of it. To be sure, it will be quite a job; but there is no work particularly urgent at present, and I've long wanted to make this yard a model. Just you begin over there at the corner, between those two rows of hives, and see how much work it will be, and how it will look. I shall be back in a moment, as soon as I can take a look at the new mammoth wax-extractor. I declare! if we don't get different weather, there won't be sunshine enough to test it this summer. There has been nearly two weeks now that the wax has not melted enough to run. At this rate the moth worms will eat up all of my combs before they can be melted out. I will just wheel it out between the buildings in that open space, where the sun shines stronger."

H. R. BOARDMAN.

East Townsend, Huron Co., O.

Old friend, you have hit me exactly in the above. I have studied and experimented, and I am sure it pays to have a good doorway; but it is a harder matter than you think, to make one that will be permanent. It is not a very big job to take a sharp shovel and go over the apiary, say once in two weeks, in the growing season; but some way there are very few who do it. Sawdust is objectionable, as has been explained. White sand does better, but the weeds grow up through it. Not long ago I suggested sawed flagging. For our locality, pieces, say 15 x 20 or 18 x 24 would not cost very much. I think, however, that slate would be still cheaper, but the latter would be in danger of breaking if a heavy man like Doolittle and some of the rest should step on them; and I believe I would rather have the sawed flagging besides. Will some one who is in the quarry business please tell us about what it would cost? We will also make inquiries. Yes, friend B., it does make a difference with me whether I have a good road to walk on or not; and I think more about it now since I am getting well along in years than I used to. From the creek garden to the house there is a nice, smooth, well-trodden path, but it has a

good many windings. A great many times, when weary, I ask myself which I shall do—take a straight line for the house, over the soft ground, or go nearly twice as far to follow the hard well-trodden path. I believe it tires me less to take the longer route; and I am sure it is very poor economy to make our bees travel or take wing again when they fall around the entrances. Through California and Wisconsin I watched the apiaries to see what provision had been made for an alighting-place. A good many used boards; but by far the greater part did nothing at all; and where an apiary was literally choked up with weeds and brush, I knew beforehand that the owner would tell that it "didn't pay expenses." I don't believe I like cows or horses in an apiary, and I am sure I do not like rabbits, as friend Fradenburg has advised. The greatest trouble with rabbits is, that there are soon too many of them. I hope you will tell us more about that mammoth wax-extractor.

DOOLITTLE'S REPORT FOR 1889.

GIVING THE DARK SIDE.

A BEE-KEEPING neighbor happened in a few days ago, and, in speaking of the poorness of the season, he said: "You will not report this season, I suppose, owing to the light crop of honey which you have; for I notice that there are not many who go into print with a report unless they have a very large crop." I told him I should give my report again this year the same as I always had, for I did not consider it the fair thing for a bee-keeper to do, to tell of his large yields only, and then censure the editors of our bee-publications for giving only the "bright side" of apiculture, as some have been known to do, when bee-keepers gave only the largest yields, withholding a report at all other times. Only as reverses are reported equally with the large yields, can we get a true idea of the value there is in apiculture as a pursuit; and he who purposely withholds the dark side of any matter must be considered one who would purposely deceive. I am glad to know, however, that the most of those who report for our bee-papers are generally willing to give the dark as well as the bright side of bee-keeping.

The season of 1889 has been a peculiar one. The month of March, which, as a rule, is the most rough and unpleasant month of the whole year, in this locality proved to be the most calm and pleasant of any we have had so far, considering the time of year. This gave the bees which were outdoors an early start; and as April continued nearly as fine, high hopes were entertained for the season of 1889 as a honey year. Very few cold storms occurred up to May 20, at which time the bees had so advanced that some of the stronger colonies were thinking about swarming, they having queen-cells started while the weaker ones were fully as good as the strongest are usually at this season of the year. But, alas! the shortness of human vision is such that it can not foretell what the season will turn out to be; hence, right in the midst of our high hopes came the most disastrous weather for the bees that I ever experienced; for on May 20th came a cold rainstorm which kept the bees in their hives for a whole week, at the end of which it froze so hard that the bees in the smaller colonies were

obliged to contract to such an extent that much of the brood perished, while all of the colonies ceased breeding pretty much entirely. This weather continued to a greater or less extent together with much rain till June 12th, at which time the prospect of a honey crop was nearly ruined; for all know that it is the bees which hatch from the eggs laid by the queen about 37 days before the honey harvest, which procure the crop, if we are to have any. As our basswood (which is our main honey crop) blooms about July 10th, it will be seen that this almost entire absence of brood from May 20th to June 12th took away the bees which should have been the gatherers of our honey, so that, no matter how good the weather might have been during basswood, it would be impossible to secure a full crop. June 12th there came better weather, and the bees (which by this time were broodless, and many of them nearly honeyless) went to the fields to work with a will. The rainy weather had brought on the white clover so that there was a greater show of bloom than we usually have; and could it have come off dry at this time we might have obtained more than usual from this source; but as the weather still continued wet, little more was obtained than enough to feed the brood, which now multiplied very rapidly. The early spring brought out the basswood bloom earlier than usual, so that the flowers on the earliest trees opened on the 4th of July, but the bees did not seem to notice them much if any till nearly a week later. They now began to gather honey quite rapidly; in fact, they came in as heavily loaded as I have ever seen them, dropping short of the hive, and tumbling about in every direction, as they always do when getting honey very fast; but when it came to their storing it in the hives and sections, very slow work indeed was made, owing to the fewness of the laborers, and also to the thinness of the nectar, this last being caused by its raining nearly every day at some period during each 24 hours. The basswood bloom lasted for about three weeks, at the end of which time teasel gave a little honey for a week or so, when the honey season from flowers was over for 1889, for of late years we get no honey from buckwheat or fall bloom.

I now took off all of the sections, and found that the bees did not have half enough honey in the brood-apartment of the hive to winter them; for, owing to the slow way honey had come in, brooding had been kept up to a much greater extent than usual during July. I saw nothing ahead but feeding for winter, till about the 28th of August, when the bees appeared to be at work on something, enough to keep them from robbing, the yield increasing, till on September 1st they again dropped about the hives nearly as much as they did during basswood bloom. An investigation of the matter proved that this honey came from the leaves of the oak, elm, and hickory trees, growing in a large piece of woods about $1\frac{1}{2}$ miles distant, this being the first honey-dew honey ever obtained by my bees during the period of 20 years which I have kept bees. From this source, which lasted for about 12 days, the bees filled up their hives so that they had enough to winter on; and although I have some fears regarding how they will come out next spring, I have concluded to let them chance it, rather than go through the work of extracting, and feeding high-priced sugar.

After my sales of bees and queens in early

spring, I found I had 26 colonies left to begin the season with, and from these I obtained an increase of 18 colonies, which, with 4 colonies made by doubling up nuclei, gives me 48 to go into winter with. Besides the increase, I obtained 651 lbs. of comb honey and 103 pounds of extracted, or 754 in all, from the 26 colonies in the spring. This gives an average of 29 pounds to each colony, which is the lightest yield I ever obtained, if my memory serves me right. The comb honey I have shipped on commission, which is being sold at 17 cts. per pound.

G. M. DOOLITTLE.

Borodino, N. Y., Oct. 21, 1889.

I suppose we are not to understand, friend D., that 754 pounds was your sole income for the season's work. Quite likely your sale of bees and queens amounted to a good deal more than that sum. I presume we are to understand that the 26 colonies you mention were worked solely for honey, and did not furnish bees and queens to fill orders during the summer time. If so, then you certainly have had an exceedingly poor season; and, by the way, while I recommend selling bees and queens where the opportunity offers, as well as honey and wax, I feel pretty certain also that a traffic in bees and queens is pretty sure to interfere more or less with the best results in the way of honey. Where one has a large apiary or out-apiaries, however, very likely it would not pay him to fuss with the bee and queen trade at all, on the principle that it is better to do one thing well than to try to do too many things.

HONEY-EXTRACTORS.

THEIR CONSTRUCTION; THE REVERSIBLE EXTRACTORS IN PARTICULAR.

HAVING tried nearly all kinds of extractors, from the most primitive two-comb up to an eight-comb reversible, I think my experience might be of some value to any one contemplating the purchase or manufacture of a new machine. My first extractor consisted of two tin boxes, each the length of my hive, 4 in. deeper and 4 in. wider, fastened to a wooden frame about 18 in. apart, with an axle in the center between the two cans, and a crank on top. Each can had a piece of coarse wire cloth, the size of the frame across the center of the can lengthwise, to keep the comb from the outside, and a screw cap on the bottom to let the honey out. I drew off the honey into milk-pans, and poured it through a cheese-cloth strainer into a barrel. Yes, and I believe I had more enthusiasm when running that thing, and extracting 200 or 300 pounds per day, than I have now with the best kind of an outfit, and extracting 2000 or 3000 lbs. per day.

I next tried a Novice. As most of you know its good and bad qualities, I will not mention them.

The next was a four-comb reversible. I found this a great improvement over the non-reversible, not only in saving time, but in saving combs; for with the former the comb sometimes presses into the wire cloth when you extract the first side; and, if tender, will often pull out of the frame when you pull it loose; but with the latter, the centrifugal force pulls evenly on the whole comb until it comes loose, and combs are very seldom broken.

Next my neighbor, Mr. Dudley, had a six-comb reversible made, with a ring around the axle, and a small chain running from the ring to the out end of each basket. The idea was, to pull up on the ring and make all the baskets turn at once; but it did not work. The baskets hit each other, and became tangled almost every time you tried to reverse it; so he took the chains off and reversed the baskets one at a time. Then my father-in-law, Mr. Wilkin, wanted an eight-comb reversible, and concluded to build it himself if I would help. I did so, and we put up probably the first eight-comb extractor in the country; but the baskets had to be reversed one at a time. We found that it required more force to throw the honey out when the combs made a large circle than it did when the circle was smaller, and the machine made the work harder than a four-comb. To illustrate: When I was a boy we made what we called a "whirligig" by boring a hole in the center of a plank and placing it on a post about three feet high, and driving a pin down

MCINTYRE'S REVERSIBLE EXTRACTOR.

through the hole in the plank into a hole in the top of the post. One boy would get on each end of the plank, and a third would push it around; if the plank was short, the boy pushing could make the other boys fly off the end of the plank in spite of all they could do to hang on; but if the plank was long, he could not throw them off. After trying all sizes up to eight combs, I would take a four-comb in preference to any other size, at the same price.

Then Mr. Stanley came out with his patent automatic reversible. My neighbor, Mr. Kenney, has one, and it is a well-made machine, but it is not quite so handy to put the combs in and take them out as it is when the side of the comb is toward you, and the baskets often hit each other in reversing.

Next Mr. Squire, of Santa Barbara, Cal., came out with a very simple arrangement for reversing the comb-baskets all at once. He made some hardwood wheels, about three inches in diameter, with two grooves around the edge, and fastened them securely on the axles of the comb-baskets; then put a screw in the edge of each wheel between the grooves, directly under the basket; then a wire was passed from one wheel to another, going around each wheel once. When it came to the screw it was wound around that to keep it from slipping. This acted like a belt; and when one basket was turned, all turned.

Mr. Hugh Warring, of this county, improved Mr. Squire's extractor by making the main axle loose, putting another wheel on it and passing the wire around this wheel also, which enabled the operator to reverse the comb-baskets without touching them by simply reversing the crank. This extractor worked well; the comb-baskets would reverse easily, and never touch each other; but the strain of stopping and starting all came on the wire, which would often break and give the bee-keeper the bother of having to stop and put another on.

One night, while thinking of this extractor, the idea popped into my head how to make an extractor without either wire or wood wheels, that would work the same as this one. Next morning I made a wooden model to see how it would work. The model worked beautifully, and some of my friends advised me to get it patented. I said, "No, I will never be a patent-right vender, and I don't want to go into the manufacturing business; besides, I have been greatly benefited by the ideas of others; and if some one should be benefited by my idea it will not grieve me a particle." But I wanted an extractor made that way, so I took the model down to Ventura and told the tinner I would let him have it on condition that, if he made the extractors to sell, he should give me one of them. When I took out the model and gave it a few turns, he said, "When do you want your extractor?" He made and sold them with the Stanley standing beside them. Most customers took mine because they reversed so much easier and nicer, and the baskets never touched each other, although Stanley's was much better made. The idea that struck me was to turn each basket from the center axle by means of a small lever running out on the arm that supports the basket. The frame that holds the baskets is loose on the center axle, but supported on the same by a collar shrunk on near the lower end. I inclose a drawing of the reversing gear, which will help to make it clear. The wheel in the middle is keyed fast to the main axle. The little half-wheels on the outside are fastened securely to the axle of the baskets. They should be two inches in diameter, and the one in the center four inches. The levers between, with the cogs on each end, should be malleable cast, and have a little hub in the middle where the pivot comes up through that they turn on. They vary in length according to the width of the comb to be extracted. As the gear stands in the diagram, the comb-baskets would be pointing to the center, or standing directly over the levers, and their inner edge should come about even with the edge of the middle wheel. J. F. MCINTYRE.

Fillmore, Cal., Sept. 2, 1889.

Friend M., you are perhaps aware that I made the first metal honey-extractor in the world—at least so far as I know. For sev-

eral years I was constantly experimenting on different distances from the center-shaft, also with an extractor to be turned with a crank directly on top of the shaft, instead of being connected with gearing; with extractors to hold three or four frames instead of two; extractors to be run by power applied to the bottom and on top; with a belt or strap to unwind, etc. Now, it is a little encouraging to know that my experiments agree almost exactly with yours. At first we made our Langstroth-frame extractors with the combs on end, standing quite near the shaft, that we might use a can of tin made of a certain size and thus get the extractor up cheaply. After we had made and sold a good many of these, however, I had an opinion that a larger can, with combs further away, would give better results; but as they cost more, I did not make many of them. I was somewhat surprised, however, to find that a four-frame extractor did not throw out the honey better, and also that it can not be started and stopped as quickly as the old-style two-frame extractors. After I had been making them some years, Gray and Winder, Murphy, Peabody, and others, made extractors where the can revolved instead of the frame. I decided at once that all these were a mistake. I did, however, test them quite extensively. The Peabody was so neat looking and so substantial, I invested in half a dozen of them; but they were so much more laborious, compared with our light cheap extractors, that they were soon laid aside. Now, then, whenever you revolve four combs, or get your two combs too far away from the center-shaft, or whenever you revolve a heavy frame to hold combs, you make a blunder. The arrangement that holds the combs while they are revolving should be just as light as is consistent with strength; and I do believe that an expert, with a two-frame extractor, will throw out more honey than an expert with any of the great big heavy machines. There is, of course, a saving of time in having a reversible extractor; but I should have this made just as light as possible; and I would have the combs as near the shaft as possible. Your point in regard to breaking combs because they sink into the wire cloth, I am sure does not apply to any of the extractors we make. If the wire against where the combs rest is of the proper size of mesh, and supported as all of ours are, no such trouble will be experienced. Very thick honey may make it a little more difficult; but we have had no such complaint for a good many years. After the comb has been forced into the wire cloth by turning harder than need be, a reversing device will pull the comb off, perhaps better than you can get it loose by hand. But very heavy combs and very thick honey should be extracted gradually—that is, throw out a part of the honey, then reverse, and finally finish the side you extracted from first. I saw a good many reversible extractors while I was in California, but I do not remember of seeing the device you illustrate. May be I saw it and forgot it, because I examined a great many ingenious devices in a very short time. I think very likely your idea of toothed

gearing is as simple as any thing that can be devised. Is it not more trouble, however, to put in and take out the combs with any reversible extractor? Now in regard to the Stanley reversible extractors: I do not believe I found a bee-keeper in any of my travels who is now using one of them. If there is any apiarist among our readers who extracts honey by the ton, year after year, who uses a Stanley extractor, let us hear from him. I do not wish to discourage the use of these—I simply want the facts.

THE GLASS-SNAKE.

HOW IT BREAKS IN TWO.

SO many reports in regard to these strange reptiles have come in, that we have not space for them all. We have, however, decided to give place to the following:

Friend Root:—We don't exactly see the connection between "jointed snail" and queen-bees; but having had some experience with this marvel of nature on the points for which you inquire, we take pleasure in adding our mite to your store of information. It was some years ago, when we were the "boy bee-keeper" of Hawkinsville, Ga., that, while out gunning one morning, we found a snake in the grass (literally) about 18 inches long. We set the gun-stock down on him, and the snake broke in two, thus discovering he was of the much-heard-of jointed kind. We amused ourselves in seeing how badly he could be broken up. We piled the remains on top of a pine stump, and returned to the scene about 10 P. M. We had probably killed him to too dead for a resuscitation. The pieces were all there, but warmth and vitality had fled.

We witnessed one night, only a few weeks ago, from a second-story window, what seemed the rather peculiar antics of a small gray fox that had wandered into the front yard. The animal appeared to be having a lively frolic all to himself in the moonlight. Suddenly he ceased, gazed carefully about him, and then stole quietly away. The next morning, such a snake as Mr. E. McIntyre described on page 777 was found where the sport ended. He was still intact, but his head had been "chawed." Should another specimen fall into our hands we will send it to Prof. Cook, for the tail is not "horny substance," and differs little, apparently, from any other snake's tail, beyond the body proper, except that it breaks readily anywhere the blow falls—at every joint of the vertebra.

We do not agree that the tail is or should of necessity be similar to the rattles of the rattlesnake, or devoid of life in itself, as there is told us of a lizard in portions of Africa and Australia that possesses the property not only of having its tail broken off without injury, but can even discard the same at pleasure when pursued. This tail retains its vitality for some while, and is usually active for several minutes. The pursuer, being attracted by the discarded member, the lizard scampers off and a new tail grows out.

As to the queen and drone of the honey-bees acting similar to Prof. Cook's observations on the bumble bee, we think there can be little question, as the drone must necessarily become powerless after copulation, before the queen finally succeeds in ex-

tricating herself. The drone's weight would then bear the queen down; but if this were not the case, she could not pull loose without some resistance to pull against. This resistance would be afforded by falling with the drone to some surface, and there getting rid of him, after the manner practiced by the bumble bee.

As our bees can fly out almost any time here, we are arranging to make a series of experiments concerning the question as to whether the drones from a mated queen are the pure children of the mother only. We have always been one of the doubters. We will send you the bees if we gather any evidence; at any rate, we will report progress if desired.

C. RYAN MITCHEL.

Ocala, Fla., Oct. 7, 1889.

THE JOINT SNAKES MADE OF FLESH AND BLOOD, AND NOT OF A BONY SUBSTANCE.

I read in OCTOBER GLEANINGS, p. 777, about joint snakes. You said that the part that broke off was a bony substance, without life or motion. Now, I think you are mistaken. I have killed quite a number of them in Iowa; and where they broke in two the body was composed of flesh. They do not unite after being broken; but if only a short piece is broken from the tail, the snake will live minus the piece. If you had been in California during the summer you could have seen "swifts," a small animal much like the lizard. It has four feet, and a long tapering tail. Now, if you should catch him by the tail, or strike the tail with a whip, off it comes, and it will show signs of life by wiggling about for some time. Now, this tail is not bony, but flesh and muscles.

F. A. BLISS.

Duarte, Cal., Oct. 11, 1889.

JOINT, OR GRASS SNAKES, A REALITY.

I have seen numbers of them. There is no hard, horny substance about them except the head, and possibly small scales. It may be that they are mostly tail, as is stated by Mr. McIntyre. I can't say; but I do know that they snap in two almost as readily as a glass tube, seeming tougher as they near the head. I have broken them in many pieces, and they remain so until decomposed. They show no blood, as we understand blood, when broken, but I have sometimes noticed a colorless, sticky exudation from the broken parts. The joint, grass, or glass snake, is a reality. I have seen him many times, and he is quite pretty. Ordinarily he would be called a garter snake, but he certainly is not.

J. M. SHUCK.

Des Moines, Ia., Oct. 5, 1889.

THE GLASS, OR JOINT SNAKE; HOW IT BREAKS.

Mr. E. McIntyre, in GLEANINGS, page 777, gives a good description of the glass-snake, except the length of the body part and the shape of the break joint. I captured one in Kansas, a few miles southwest of Emporia, and carried it to the house to show to those who had never seen such a snake. There I studied the anatomy of the reptile. It was about 2 feet long, about $\frac{3}{4}$ tail, which I broke in short pieces, and put them together. The break showed 3 dovetails on each piece—pointed, or miter shaped, as smooth as if done with a carpenter's chisel. The dovetails were about $\frac{1}{2}$ of an inch long. I wrote a description, and sent a drawing of the dovetailed or miter break to my sister, Mrs. Laura Henderson, in Pennsylvania. The short miter-shaped muscles were used in propelling the snake,

and looked nicer to eat than the interior of an oyster. There was no horny substance except the skin.

D. TYRRELL, M. D.

Toulon, Ill., Oct. 7, 1889.

You say you broke the snake apart and put it together again. Now, that is just the point I want to know about. If you put that snake together so he went off alive, tail and all, then I shall say again, that truth is a great deal more wonderful than fiction. I suppose, of course, that this glass-snake does not have a skin as snakes usually do. If so, how can he let his skin tear apart? Of course, you did not make that part "hitch" when you put him together again, did you? Here comes Prof. Cook to our aid:

Dear Friend Root:

I have already anticipated Mr. E. J. Baird's request, and sent an illustrated description of the whip scorpion, or "black grampus." I believe still, that the only harm that this animal can do is by its bite. Is Mr. Baird's account of the anal poisoning and switching any thing more than hearsay?

Now, friend Root, why did you not speak, when here, and I would have shown you those brittle snakes? There are two in our museum—the "blind worm," of Europe, which is really no snake at all, but a legless lizard, and the glass-snake of the South—*Ophisaurus ventralis*, which is also really a legless lizard. When these are alarmed they make their muscles rigid, and this breaks off their tails. All lizards, when caught, are apt to lose their tails in this way. Thus a person who runs a museum of lizards really needs to go into the retailing business. You see, then, that such animals do not break apart—they only lose their tails. I should like very much if some of my Southern friends would send me two or three of these glass-snakes. I will pay for all trouble and expense. I have several fine specimens from readers of GLEANINGS, received of late. I assure you that they are appreciated.

Agricultural College, Mich.

A. J. COOK.

Why, friend Cook, I should most assuredly have asked to see the glass-snake had I known you had one in the museum. With the number of testimonies furnished it would seem as though I ought to be satisfied, and yet I am not. The mystery to me is this: Call it a legless lizard, or whatever you choose, these tails are a part of the body, and must grow as the body does. Now, how could they grow without veins and arteries?

Since the above was put in type, we have received the following from Prof. Koons, of the Connecticut Agricultural School. As it corroborates the statements of Prof. Cook, and also gives us some additional very interesting information, we take pleasure in giving it to our readers, as we close the subject, at least for the time being:

Bro. Root:—I have been not a little interested in Mr. B.'s and Mr. McI.'s references to the grass-snake, in GLEANINGS for Oct. 1st. It is not a snake at all, but a retrograde lizard without feet, and is more commonly known as the glass-snake, so called because the vertebrae of the tail are so loosely articulated that they part at the slightest blow. Among scientists it is a well-known object of natural history, called by them *Ophisaurus ventralis*.

It inhabits the warmer parts of America, and is usually regarded as a snake by the masses, because of its general resemblance to that animal; yet on account of its structure it is clearly classified among the lizards. For example, snakes have no true eyelids; but this and other lizards have. Also the skeletal differences about the heads of snakes and lizards are clearly marked; and thus an extended list of characters can be given, which ally it to the lizards, and remove it from among the snakes, notwithstanding its general resemblance to the latter. This glass-snake inhabits the drier localities, where it often burrows in the ground, and is a harmless little creature. Bro. McL's discovery, that three or four inches of the head is all the body there is, is explained by the fact that it is a little lizard with a very long tail. There is an erroneous opinion somewhat common, that the pieces of the tail, after being broken off, often join the body again. This false notion is explained by the fact that in this, as in many of the lower forms of animals, lost parts soon grow out again. Starfish furnish frequent illustrations of this quality, as it is a daily occurrence to find them with one arm gone, but a small arm growing out to take the place of the lost member. I have one in my collection that had lost four of the arms, and the one remaining was reproducing the four lost members. The lobster also often furnishes marked illustrations of this ability to reproduce lost parts. A few years since, when engaged with others in marine researches under the auspices of the U. S. Government, we had in an aquarium one day a dilapidated old veteran lobster which looked as though he was the "lone survivor of many deadly conflicts." He had one very small broken leg, one broken claw, one stub of an antenna three-fourths of an inch long, and his tail damaged. Upon shedding his skin, as all crustacea (the lobster and crab group) do periodically, he came out perfectly whole, antenna, claw, leg, and tail, as good as new, and doubtless he was ready for the next "scrimmage" in Lobstertown.

PROF. B. F. KOONS.

Storrs, Ct., Oct. 7, 1889.

ALFALFA.

HOW THAT 20,000 LBS. OF HONEY WAS SECURED.

YOU ask me to tell you and the readers of GLEANINGS how I made that 20,000 lbs. of honey from 190 colonies, spring count. I should have made double that amount if it had been a good season, but we have some drawbacks; viz., 1. I moved my bees three miles in March after they had commenced to swarm; 2. When the honey season should have commenced, the army-worm ate all the bloom from the alfalfa as fast as it came, so that the first crop of alfalfa produced no honey, and we had to depend on the wild flowers for our first crop; but the second and third crops were good; the fourth was destroyed by a small grasshopper not much larger than a flea; but he was active, and destroyed the bloom as fast as it appeared; hence there was no honey from this source. The fifth crop is fair, and we are now taking it as fast as we can; and if nothing interferes we shall probably get 100 five-gallon cans more, all from alfalfa. The season has been so poor we have saved only about 85 or 90 swarms from 190 colonies.¹

Now, friend Root, this honey was all made from

alfalfa, and other kindred plants that were dependent upon irrigation for their existence. As before stated, I moved my bees in March, three miles, to a location where they would have 11 $\frac{1}{4}$ sections of alfalfa within one mile of the apiary; but in one mile another man sat down with 200 colonies, besides several small apiaries of 25 to 30 colonies; 2 $\frac{1}{2}$ miles north, an apiary of 200 hives; 3 miles N. W., an apiary of 300 colonies, so you see if my bees could have had it all to themselves they would have doubled the yield. Another drawback was that I had an inexperienced man to take care of them on shares. I think if I had had a good man he would have succeeded better, notwithstanding all our drawbacks. Why, it sometimes took him two weeks to go through one time and extract all the honey; and when the honey-flow is good they will fill their hives in five days. One season I extracted every third or fourth day alternately, and they yielded me 485 lbs. to the hive, spring count, and they will do it again when properly cared for. I want a good and experienced bee-keeper to come and take my bees on shares, and by that means it will be very profitable to us both. I hope by this means to succeed in getting a good man to come and go into the business where it pays.

Tempe, Ariz., Sept. 17, 1889.

J. L. GREGG.

Your communication is of more value, perhaps, than you are aware of. For years we have been asking for a report in regard to a honey-crop produced entirely from artificial pasturage, or, in other words, we have asked if there was in existence an area of cultivated plants that would furnish stores right through the season, for a whole apiary. Now, your report fills the bill for an apiary of 190 colonies — yes, more too. You say other apiaries also made good results from this one field of artificial pasturage, for, of course, alfalfa was unknown until the country was settled. I am so much interested in your report that I feel a strong inclination to make a trip clear to Arizona to see the thing done. Please tell us if you get large yields of honey every season from alfalfa. If you depend on irrigation, why should it not be a fixed fact every year? It is true, that army-worms and insects may spoil the crop; but when you talk about your fifth crop in a single season it seems to me you must be pretty near the bee-keeper's paradise. You spoke of an alfalfa field covering 11 $\frac{1}{4}$ sections—or, if I am correct, 1760 acres. I did not know there were 1760 acres, all in one piece, in honey-bearing plants, on the face of the earth—that is, cultivated acres; and this is not only cultivated, but irrigated. Why did not some one tell me there was such a state of affairs, when I made my recent trip to California? Besides, my youngest brother is near neighbor to you, if I am correct. Now, I wish that both of you would give me a longer letter of particulars. How often is alfalfa irrigated? Do they cover the ground with water as they do in California? What is the land, crop and all, worth per acre? With your warm climate, and no winter, what is to hinder having a steady flow of honey constantly the whole year through? for it would be an easy matter to have the alfalfa come so as to give constant bloom at least one part at a time. Can't you

answer for us that difficult question as to how many acres of honey-plants it takes to keep, say, 100 colonies of bees fairly employed?

BRANTFORD OR BUFFALO—WHICH, FOR THE NEXT N. A. B. K. A.?

DR. MILLER ARGUES IN FAVOR OF BUFFALO.

I HAVE just read what is said in GLEANINGS about the next convention. I am not just sure at this instant what its proper name is, but I am sure it is *not* "International." In spite of any preparations that have been based on its being held at Brantford, I believe that more good than harm would be done by changing to Buffalo. Reasons for this have been already given in GLEANINGS and in the *A. B. J.* Without looking the matter up, I do not know whether it would cost me more or less to go to Buffalo; but I know I would rather pay more, and go to Buffalo. I suspect many others feel the same way, both in Canada and in the U. S. Secretary Holtermann says, "Personally I should prefer Buffalo;" and is it not possible that so many others feel the same way that a larger number from Canada alone would go to Buffalo than to Brantford? It may be said, "Brantford this year, Buffalo next." If the convention is held at Brantford this year, would it be right to hold it 70 miles distant the next year? If it moves only 70 miles per annum, especially when so far to the north, I am afraid it will lose what little right it has to be called any thing but a local society, which right is none too great at best; for, as friend Macpherson says, "It is a well-known fact, that the great bulk of the membership each year comes from the vicinity where the annual meeting is held." So, change from Brantford to Buffalo this year, if enough favor it; but don't talk about holding it a second year within a distance of a hundred miles, unless you want to kill it outright.

Marengo, Ill., Oct. 19, 1889.

C. C. MILLER.

Thanks, doctor, for what you say. I had begun to feel as if I had wasted a good deal of "wind" for nothing, and, besides, had put the Canadians to no little annoyance. If I had not supposed that the *Canadian Bee Journal* had first urged such a change, the matter would never have been brought up. I still think that an outside attraction such as the Falls would very materially increase the attendance held at Buffalo. It makes our pocket-books feel a little better if, having invested so much, we can go to a bee-convention, and see one of the wonders of the world at the same time. It is on the principle of killing two birds with one stone. Many of us feel, when bee-journals cover the ground usually traversed at conventions, that it is a good deal to pay out for hand-shaking and apicultural fellowship, much as we value it. But if we can "take in" something else on the same car-fare, this money is gladly paid out. As I said before, I reiterate again: I would a good deal rather attend a national convention with a *large attendance* with some interruptions, than one *poorly attended*, with no interruptions. Still, for all that, I presume Mr. Newman's advice in the *American Bee Journal* of Oct. 16, that the matter be dropped where it is, is wise.

Later.—The last *Canadian Bee Journal* has just come to hand, and I find that it would not be according to the constitution of the society to change at this time. For this and other reasons, it were better that the matter be dismissed at once, and that, in the language of Bro. Newman, we labor faithfully to make the convention at Brantford a successful and interesting occasion. While I regret my action in the matter, I believe that the association will profit materially in the "extra advertising." It was with the best of intentions toward the Canadians that I proposed, or rather, as I thought, *seconded* the change to Buffalo. I did not for one moment doubt their interest in the association or their ability to give a right royal reception to the bee-keepers of the United States. If I carelessly interpreted Macpherson's original editorial, which perhaps I did, I beg pardon. I think too much of the rosy-faced, robust, large-hearted Canucks to merit their ill will. ERNEST.

MANUM'S NURSERY, OR QUEEN-HATCHERY.

FURTHER EXPLANATION, WITH AN ILLUSTRATION.

THE engraving of my little queen-cell protector or that appears in GLEANINGS, Aug. 1, page 629, has caused so many to write me, asking all about it — its size, cost, usefulness, whether a success, where it can be obtained, etc., besides the many samples called for—that I have thought best to give the readers of GLEANINGS a full description of the cage and nursery as I use it, that every one may make his own if he wishes.

MANUM'S QUEEN-NURSERIES READY FOR HIVE.

The accompanying cut of nursery will perhaps explain itself better, than words from me. I use a half-depth frame for convenience. It will be seen that this frame holds 16 cages. A full-size Simplicity frame will hold 36 cages by having them made $\frac{1}{2}$ shorter than those I use; but I should prefer to cut the frame down, and have only 2 rows, or 24 cages, as I find it convenient to have one nursery to contain cells of a certain stage of advancement, and another with cells of another age; and as I breed from queens in different apiaries, I like to have each set of cells in a nursery by themselves; hence I have a number of these nurseries in use.

THE CAGE, OR PROTECTOR.

This is a simple wooden box that I have made for this purpose. It is $2\frac{1}{4}$ inches long by $1\frac{1}{2}$ wide, by 1 inch deep, outside measure. The top end of the box is $\frac{1}{2}$ narrower than the bottom, to allow the

wire-cloth cover—or slide—to slide into the grooves made in the edges of the side pieces. I have thought of making them with wire-cloth bottom—or back—but I hardly think it necessary, the box being stronger as it is. The slide is made of wire cloth cut a little wider and longer than the size of the box. A piece of tin, the proper size, is used as a form to turn the edges of the cloth, that it may slide in the grooves easier than the raw edge would; and, besides, the slides keep their shape better by having folded edges.

The hooks which hold the cells in place are made by cutting tin points from a strip of tin $\frac{1}{2}$ wide. A representation of these points may be seen in GLEANINGS for Aug. 1, page 629. With the point of a pocket-knife, an incision is made in the center of the top end, and the tin point is driven through into the box, and the point bent up to form a hook on which the queen-cell is hung by the upper end of the cell; then the wire-cloth cover is slid in place, and the cage is ready for the nursery.

These cages, or protectors, can be furnished for 5 cts. each by mail; or just the bare box can be furnished by express at \$2.00 per 100. Possibly Mr. Root can furnish them cheaper.

THE NURSERY, OR FRAME.

This is an ordinary brood-frame, with end-bars cut shorter, so that two rows of boxes and center-bar will just fill the space; hence the end-bars should be $\frac{3}{4}$ long, as the center-bar is $\frac{1}{2}$ thick. This center-bar is kept in place by fitting it into grooves made in the end-bars—see engraving. For a back to this frame, an ordinary tin separator may be used. I use a wooden separator, as I have no tin ones. I use the nursery something after the Doolittle plan, though I place them not only in upper stories, but in any hive or nucleus I wish to, whether they have a laying queen or not. I find that the bees will not always feed the young virgin queens in these nurseries after the honey season is past; hence they should be watched at such times, and fed or removed as soon as hatched. I have hatched queens over and in full colonies for several years, and supposed everybody else did, though I did it on a different plan from this; but this arrangement suits me much better than anything I ever tried before.

I find that queen-excluding honey-boards are unnecessary for this work, as I have never used them, either for hatching queens or having queen-cells completed after being started in other hives. I have never had such cells torn down, nor have they ever, to my knowledge, caused a swarm to issue.

All honor to our good friend G. M. Doolittle for the many good points he has given us in queen-rearing, though I have never seen his new book.

Bristol, Vt., Aug. 21, 1889.

A. E. MANUM.

BEES, BEANS, ETC.

WHY THOSE BEANS DID NOT COME UP.

I SUPPOSE the beans you spoke of several times, as not doing well, did not grow because they had never thoroughly ripened. I remember when I was a boy my father always grew beans for feed for horses and hogs. Those intended for the horses were always kiln-dried, if not harvested well, or not quite dry; damp new beans being very injurious to horses. One time, in planting for the next crop we ran short of seed. After a

good deal of argument, pro and con, the last three-fourths of an acre was planted with kiln-dried beans. These last were up first, produced the best crop, and were three weeks ahead of the others at harvest. Does not that look as if a seed must be dry, to be ripe?

THE CLOVER BLOAT.

I remember my father, having a lot of cows blown with clover, though there was a man put to watch them. That was in the early part of the fifties—about 1854, I think. What impressed it on my mind was, they got them all into the barnyard as quickly as possible, and tied sticks in their mouths to keep them open, and all so treated recovered but one cow. She would not be caught, and was driven into the barn. The floor was paved with blue bricks, and was very slippery; and in trying to avoid being caught, the cow slipped down and burst.

SPEED OF BEES; AN INTERESTING CASE.

With regard to the speed of bees in flight: Some years ago, in England, I was out on an engine, that we had rebuilt, during her trial trip. A bumble-bee took a fancy to investigate us, and after looking us over on all sides it commenced making a circle around the smokestack, varying from one foot to three feet from it. He seemed to do it with the greatest ease, for several minutes, and then left us, to find himself six or eight miles from where he first joined us. We were going close on to sixty miles an hour. How fast was the bee going, when circling around the smoke-stack?

TO GET WAX OFF FROM UTENSILS.

The best way I know to get wax off from any kind of vessel is to warm them so as to soften the wax a little, then get some clean sawdust, and a coarse rag, and it's just fun to get it off. A teaspoonful each of soot and lime will be plenty to test for ammonia.

GEO. E. HAILES.

Lytle, Tex., Sept. 20, 1889.

Friend H., you have given us several things of a great deal of value. The result of that experiment with the beans corroborates exactly the experiment I gave, of planting beans just as soon as they were of full size, but not dry. Now, is there not here a point for our experiment stations to settle? Will our good friend W. J. Green please tell us whether garden seeds are all of them better to be kiln-dried? Since you suggest it, friend H., I recall quite a number of instances that seemed to indicate that seeds must be thoroughly dried, as well as thoroughly ripened. Our garden seeds are in a room warmed by steam, and so near one of the radiators that I have sometimes feared they would get so exceedingly dry it might be hard to moisten them up quick enough to have them start real early in the spring. Your fact, however, indicates that they are just right as they are.—I am glad to have you corroborate the remedy recently given for clover bloat.—If a bumble-bee flies considerably more than a mile a minute, how fast may a honey-bee go if it tries? Surely it can get ahead of its big country cousin.—If lime causes soot to give off ammonia, then soot is, without question, valuable for manure. I know it has been many times recommended, but I was slow to accept it, because I could not see any reason why. Will friend Green also tell what he knows about the value of soot as a manure?

APHIDÆ—EGGS AND NO EGGS.

ARE THERE ANY INSECTS WHICH REPRODUCE THEIR SPECIES WITHOUT EGGS?

IN GLEANINGS of April 1st, page 265, Prof. Cook has a short article on house-flies. In it he says: "House flies do not breed in winter, and all insects come from eggs." And, again, at the close of the article he reiterates the latter statement: "All insects come from eggs," and adds: "Any observations that seem to contradict these statements need to be repeated."

I agree with him in regard to what he says about house-flies; but when he says that "*all insects come from eggs*" it seems to me that that statement is a little "too sweeping." I always had the idea that they all came from eggs, until within the last year or two, when my own personal observation forced me to come to the conclusion that there must be some exceptions to that rule. In studying the subject to find out what others thought, I found some items which I think might prove as interesting to others as they have to me.

Here is an extract from Zell's Cyclopedia, in regard to the particular family of insects which I was studying.

APHIDÆ.

A family of hemipterous insects which have the body short, and furnished at the hind extremity with two little tubes, or pores, from which exude minute drops of a very sweet fluid, called honeydew, which is eagerly sought after by ants. The genus *Aphis*, or plant-lice, inhabit all kinds of plants, the leaves and softer portions being often completely covered with them. The *Aphis humuli*, or hop-fly, is in some years very destructive to the crop; and it is to this cause that the variations of the hop-crop, from year to year, are mainly due. The young are hatched in the spring, and soon come to maturity; and, what is remarkable, the whole brood consists of wingless females; and, what is still more remarkable, these females bring forth living young, each female producing 15 or 20 in a day. These young are also wingless females, and at maturity bring forth living young, which are also all wingless females; and in this way brood after brood is produced, even to the 14th generation, in a single season, and this without the appearance of a male. But the last brood in autumn contains both males and females, which at length have wings, pair, stock the plants with eggs, and then perish. Reaumur has proved that a single aphid, in five generations, may become the progenitor of about six thousand millions of descendants.

Reaumur was a French philosopher, a member of the Academy of Sciences, a distinguished inventor, and the author of "Memoirs Illustrating the History of Insects." He died in 1757. According to this account of the aphid, these insects are produced from eggs, and also produce young in a living state; the latter more than the former, and in multitudes. Those of us who have plants, and know from personal experience what a pest these "little varmints" are; how rapidly they increase, and how almost impossible it is to get rid of them, are quite willing to believe that they do not wait to be hatched, but come in battalions, ready for work. You can take a clean plant, one that you know is not infested, and place half a dozen of these wingless females on it; then set it away where it will not come in contact with other plants, and do not disturb it for a few days. If you examine it in two or three days I think you will be surprised at the swarms of aphid, of various sizes, which you will find. If you have the same experience we have had, you will find them ranging in size from the smallest specimen imaginable, up to those fully grown. Look at

your plant daily, and you will find young insects the first day, and every day.

Ipava, Ill.

ANNA B. QUILLIN.

The above was sent to Prof. Cook, who replies as follows:

ALL INSECTS COME FROM EGGS.

I have read Miss A. B. Quillin's interesting communication, with no small interest. The facts which she gives are indeed facts, but they do not warrant her conclusions, as I will show. It will be profitable right here to describe not only the three kinds of sexual reproduction, but also the three kinds of reproduction.

The first kind of reproduction, called reproduction by fission, is simply division. The animal breaks apart, and, presto! there are two animals in lieu of one. This is the only reproduction in the lowest branch of animals, like the curious amoeba—the one-celled animals, or the protozoa. Reproduction by fission is also confined to the lower branches of the animal kingdom, though in all but the protozoa it is attended with other kinds or modes of increase. Thus, the beautiful fresh-water hydra, though it reproduces by both the other styles of reproduction, yet if, even by accident, it be cut in two, or even sliced up, each part becomes a perfect animal.

The second kind of reproduction is by gemmation, or budding. A bud develops on the side of the animal, finally drops off, and there is a second animal. Gemmation is also confined to the lower branches of animals. It is well illustrated in coral animals, or polyps. It is always attended with sexual reproduction, and sometimes with fission.

Sexual reproduction is reproduction from eggs. Sometimes these eggs develop with no outside vivifying influence. This is parthenogenesis, or agamic reproduction—reproduction without males. Usually the eggs must receive sperm-cells—must be impregnated, or they come to naught. The eggs are produced in special organs—ovaries—and the sperm-cells in other special organs known as testes. In some cases these two kinds of organs exist in the same animal, and we call such an animal monœcious, or a hermaphrodite. Usually—always among insects and vertebrates—the sex organs are in distinct individuals, and we call such animals bisexual, or dioecious. Even animals as high as snails and angleworms are hermaphrodites. Often the highest animals like some insects appear to be both male and female. This, however, is only superficial. The animal is really either male or female.

Now, while all higher life, even to man, comes from eggs, this appears not to be the case; and it is not strange that our good friend thought I had overstated the matter. There are three kinds of sexual animals. First, the oviparous. These animals lay eggs which develop outside the mother animal, from nutriment contained mainly in the egg substance. Most insects, fish, reptiles, and all birds, are oviparous.

Second, the ovoviviparous. These animals differ from the oviparous only in that the eggs hatch inside the mother, and so the young are brought forth alive, and not as eggs. The nutriment, as before, comes from the substance stored in the egg. Here we find the plant-lice referred to, which are also agamic, the sheep-ticks, several two-winged flies, sharks, and some snakes.

Lastly we have viviparous animals, which include man and nearly all mammals—there are two

exceptions among Australian mammals. These two are oviparous. In these animals the eggs hatch within the mother, and furnish but a very small part of the nourishment for the embryo, or pre-natal animal. In this case a curious and very vascular organ brings the blood of the mother and fetus, or yet unborn, in close contact, and thus the fetus gets blood, oxygen, and whatever is necessary to its growth and development. Thus we can say in truth that all insects, vertebrates, and many other animals, come from eggs. A. J. Cook.

Agricultural College, Mich.

My good friends, I am exceedingly obliged to both of you. Our good friend Anna Quillin explains what I have alluded to on another page in regard to the green fly; but I confess that I was never aware that they multiplied at such an enormous rate. Why, it is almost fearful to contemplate. Your explanation gives us a glimpse of the wonderful intricacy and complexity of your chosen line of work—entomology. If I ever had an inclination to think that I knew pretty much all there is to be known in that branch of science, your answer has thoroughly cured me, and it makes me feel like taking a very low and humble seat while I repeat the words of the Psalmist, "How manifold are thy works, O Lord! in wisdom hast thou made them all."

THE COST OF MOVING BEES.

THE RAMBLER REPLIES TO DOOLITTLE, ON PAGE 666.

THE Rambler read Bro. Doolittle's article in GLEANINGS for Aug. 15, p. 666, on the cost of moving bees, and was placidly happy to see Dr. Mason get punched in such fine style.

"Why, yes," said we; "what a preposterous idea for a doctor to advance!" No wonder he is baldheaded. We wonder if he runs loose, and boards in a schoolhouse, as the boys say. Well, we smiled along down the column until the Rambler was hit. We "riz right up," shook our fist in the air, and, said we, "It's an outrageous imputation. We never said we could prepare a swarm, load it, go five miles, unload, unprepare it, all in four minutes. What does Doolittle take us for—a telegraph, a telephone, or a streak of greased lightning?"

After this effervescence we calmed down, and finally grasped the situation. We immediately leaned back in our chair, put our feet on top of the bureau, and went into a clairvoyant condition, and saw Bro. D. prepare a swarm for moving. First he got a milking-stool and calmly sat down by the side of a bee-hive; then that little ornamental pile of stones was carefully laid on a newspaper (wonder if he keeps them varnished); shade-board, cover, quilt, and several other fixings were also carefully removed; then each frame secured, ventilation provided, entrance closed, etc., then the milking-stool and man were transferred to the next hive for another half-hours' work, 25 cts. an hour. No, sir, we wouldn't work that way for \$1.00 an hour. If we did our hair would all come out, and we should be as baldheaded as Dr. Mason.

Now, to get a colony ready real quick, use a closed-end frame. The Rambler uses such a hive. It is provided with a stand that can be used as a ventilating-rim for wintering or moving bees. Put on

the veil, take a smoker, an extra bottom-board and rim, approach the hive, lay the bottom-board on the ground, upper side down, place the rim upon it. This closes the entrance. Place the hive carefully upon the rim; pass a strong cord—several having previously been tied in the form of a loop—around the hive; take a few twists in it, with a stout stick, and the job is done, and quicker than we have been writing it. We then take up the bottom-board and rim that have just been vacated, and proceed to the next hive. We can fix a hive in this way in the spring in two minutes; but if prepared in the swarming season it would take longer; but even then the work could be so systematized as to be done rapidly.

Now, in answer to Bro. D.'s 25-cent-per-hour query, I would say yes. I will work for 25 cents per hour in any bee-yard in the country, for one, two, or three months; 25 cents per hour for each day of 10 hours means \$65 per month. But the bee-keeper making a specialty of the business must reckon his pay so as to cover the entire year. At 25 cents per hour it would amount to nearly \$800. Now, I wish to ask how many bee-keepers having 200 colonies, and making a specialty of honey production, have, during the past five years, averaged \$800 per year.

The Rambler's experience has been somewhat varied. One year in the five has been an \$800 year, while the rest have been nearer \$200; the average has been nearly \$400, or 12½ cents per hour.

The study and close attention I have put upon the business has but little bearing upon the wages. My knowledge of bee-literature, anatomy, and botany in all their relations to honey production will not enable me to get a greater yield of honey than is obtained by the illiterate man who has learned to manipulate his colonies to advantage.

We think Bro. D. makes the mistake of ranking bee-keeping as a profession. The professional man knows every morning when the clock strikes the hour for his labors to commence, just the routine to be followed; his pay is assured, so much per year. His study and preparation have been with the knowledge that he is to occupy just such a position all the year round. If the institution fails, he is sure to find a position in another.

If the professional man is a doctor, and he is skillful, he is sure of good paying patients wherever he may locate.

To be ranked as a profession, bee-keeping must get beyond the many uncertainties that surround it; and while I am a bee-keeper, I must be controlled in the matter of wages by the pay I would receive by laboring for those who surround me, and we will guarantee that 75 per cent of the bee-keepers of to-day are drawn from the ranks of the farmers; and should they give up their pursuit, they would drop back into those ranks, accepting the pay of a farm hand, or tilling their own farm, as they might be favored by fortune. Even at present the Rambler knows many bee-keepers who, after the busy season is passed, hire out as farm hands at \$1.00 per day, and are glad to do it; and if the seasons continue as they have for the past few years, many not having the education for other pursuits will have to resort to sawing wood, carrying the hod, or feeding pigs.

We think Bro. D. and a few others are putting the business of bee culture upon stilts, too high for it. It will not bear this elevation. The great mass of honey-producers have to work hard for small

pay; and how to lighten the labor and increase the pay is a problem that gives much food for reflection to the

RAMBLER.

Good friend Rambler, we might have had an opinion that you were one of the slow and easy sort of people, as rambler's are quite apt to be; but if you can fix a hive in the way you describe, in two minutes, I guess we shall have to give it up. Have you timed yourself by the watch, or do you guess it would be about a couple of minutes? I agree with you in regard to wages. There is another point you have not yet touched upon. Those who get 25 cents an hour are usually located in the city, where expenses are far different from what it costs for board and lodging on a farm. Nowadays one is almost looked down upon if he looks for a hotel where he can get accommodations for only a dollar a day. Now, one who has to pay about a dollar a day for board certainly can not hire out for the wages paid to farm laborers. The average farmer gets board and lodging for perhaps less than 25 cents a day, therefore he can afford to work at a low price. Whenever I get back from one of my trips I always feel an additional degree of satisfaction with both bed and board at home. We have just what we want to eat at home, and a good bed to sleep in. Our meals do not cost 50 cents apiece, nor does a good comfortable bed cost half a dollar, or two dollars or more if you take a Pullman sleeper. Give me a farm or the suburbs of a country town, rather than the city with all its privileges.

EXHIBITING AT FAIRS.

CORNERING UP THOSE WHO PERSIST THAT COMB HONEY IS MANUFACTURED, AND MAKING THEM RECANT.

OUR fair passed off week before last. I was successful in capturing all the premiums pertaining to honey and bee-keepers' supplies, comb and extracted honey, and first and second on display of hives and fixtures. I had the two-story chaff hive; the one-story chaff hive, with the Simplicity top and also without; the Simplicity portico hive with all its combinations; zinc queen-excluders, crates, T supers, etc. But the greatest novelty I had on the fairground was the extractor. It created more queer expressions than all the other stuff I had. Some people would call it a washing-machine; some an ice-cream freezer, others a machine to manufacture artificial honey, and there is just where the fun would come in sometimes. Some would contend that artificial comb honey could be manufactured, and then out would come a pack of the \$1000-offer cards. One smart Alec from Iowa, who happened to be at our fair, jumped me heavy. He said there was a man who lived 1½ miles from him who followed it for a living—kept bees, though, but sold hundreds of pounds of manufactured comb honey. I let him go on till he got about to the right place, then I went for him with a vim. I had a good crowd around, and I went for him with cards, etc., till he crawled clear out. I explained to him, with a sheet of foundation in my hands, how it was made, its uses, etc., till he just confessed that he believed that was the kind of stuff the man in Iowa was

making. I have worked off a great prejudice against extracted honey in the last three years, and can sell my crop of it at the price of comb—from 15 to 20 cts. per lb.

LEWIS HOCKETT.

Fairmount, Grant Co., Ind., Oct. 3, 1889.

THE WHIP SCORPION.

PROF. COOK TELLS US SOME MORE WONDERFUL THINGS.

A SUBSCRIBER for GLEANINGS, S. C. Corwin, Sara Sota, Fla., sends me a very curious animal which he wishes me to name and describe. This I am glad to do, and to send a good drawing, made by one of my students, Mr. H. E. Weed, as the animal is not only a curiosity in itself, but is very rare in the United States. I believe this one species is all that comes within our limit; and this is found only on our very southern border. It is more common, I think, in Mexico. This is the "whip scorpion," or *Thelyphonus giganteus*. The figure gives half the natural size. The name "whip scorpion" is given because of its long lash-like tail. Its striking resemblance to the true scorpion explains that part of its name. The scientific name, *giganteus*, is easily explained, and is very appropriate. By the eight legs we are sure that this belongs to the

sub-class *Arachnoidea*, or spider group. Its jointed abdomen removes it from the true spider order, and also from the mites. Its long maxillae, or palpi, places it with the harvestmen, false scorpions, and true scorpions, in the order *Pedipalpi*. Translated, this word means foot-like palpi. These palpi are the large organs just in front of the first pair of legs. In the true scorpions and little false scorpions (chelifers) they present claspers, or forcep-like pinchers, at the end. This is true in a less degree in the whip scorpion, as is seen in the figure. These whip scorpions are easily told from true scorpions, as the long lash-like tail takes the place of the horn, or sting, of the true scorpion. Thus these animals are harmless so far as this part of the body is concerned, while the true scorpions can give a poisonous sting, which is often reported fatal to man, though it is probable that this is exaggerated.

The friend who sends this specimen asks if it be true as stated, that the tail can do fatal damage. This is another case like that of the tomato larva, where man's nonsensical fear has led to gross deception. Neither the lash of this animal nor the horn of the tomato larva is in the least harmful. The long front legs are quite remarkable in the whip scorpion. As will be seen in the figure, these front legs are nearly twice as long as the others. In this group of animals the jaws are called *chelicerae*. In these, as in true spiders, there is a poison apparatus connected with the *chelicerae*. As I have

often stated in GLEANINGS, few if any of our northern spiders can injure man by their poisonous bite. I do not know whether the same is true of this animal or not; but I suspect it may be.

Like all of the arachnoids, or spider group, this whip scorpion has only simple eyes. Of these there are eight. Two of the eyes are close together, far in front, while the other six are in groups of three each, further back and close to the side of the *cephalothorax*, as the head-thorax is called. This head-thorax, unlike the abdomen, is not divided into rings, or segments. The harvestmen (grandfather gray-beards) are the only members of this order that are common in our Northern States. These are the little animals with very long legs that always point toward the cows with these legs. This is a veritable truth, as the legs point all ways. There is one family in this order—the *Solifugæ*—which is very predaceous. One species from California, which I have illustrated in my Bee-Keeper's Guide, is known to kill bees. This is a species of *Datames*. So far as I know, this is the only species of the order that is specially interesting to bee-keepers, and I doubt if that one is ever numerous enough to do much harm. A. J. COOK.

Agricultural College, Mich., Oct. 7, 1889.

Old friend, it is exceedingly gratifying to me to find that you are read up and posted on all these matters as fast as they come up. Even the glass-snakes, grampuses, and scorpions, have already been investigated by careful, trained, and experienced intellects.

AT THE VERMONT STATE FAIR.

EDUCATING OLD FOGIES IN REGARD TO THE HONEY BUSINESS.

THIS year the Vermont State Fair Association gave a more liberal premium on apianian products than ever before. This is due to the never-tiring energy of Mr. J. H. Larrabee, secretary of the Vermont Bee-keepers' Association; consequently a larger display of honey, wax, bees, and supplies, was exhibited than I had ever seen at our State Fair; and I must say that the display of honey was an honor to those who made the exhibit.

Mr. R. H. Holmes, president of the State Association of bee-keepers, had a very fine display of both comb and extracted honey. His comb honey in 1-lb. sections was arranged in the form of an American flag, representing Mr. Holmes' Red, White, and Blue apiary. The emblem referred to was some 8 feet long by 4 or 5 wide. The red stripes were strips of wood painted red, placed at a proper distance apart to admit 1-lb. sections, which formed the white stripes; and in the upper corner, sections of honey were inserted in place of stars to represent the thirteen original States. This was fastened to a beautiful white staff, and suspended in the hall, over his large exhibit of comb honey in shipping-crates, extracted honey in various styles and sizes of glass jars and tumblers, beeswax, foundation, bee-hive, etc.

Mr. J. H. Larrabee's display of honey was not surpassed by any, as he had a very large assortment of beautiful comb honey in various sizes and styles of shipping-cases, which were arranged in a very tasty and attractive manner. I have seen a great deal of honey in the past 20 years, but I must

say that I had never seen a nicer lot of honey than that which Mr. Larrabee had at our State Fair. He also exhibited a fine lot of extracted honey, together with a Stanley extractor; also smokers, uncapping-knives, etc. Although the above-named articles attracted much attention, nothing seemed to be more attractive, or call out more comments, than did Mr. L.'s observatory hive of bees. I will say nothing about them, further than that they took the premium, although there were other bees on exhibition.

Messrs. Drake & Smith had on exhibition a full line of apianian supplies, together with a full line of their beautiful mailing sample boxes, which can not be surpassed in beauty or workmanship. These also took the first premium.

The show was a success in every respect, and I am sure that every bee-keeper who visited the fair must have felt proud of the display.

Your correspondent was much amused at the comments of the people as they approached the apianian department, having been left in charge of Mr. Larrabee's exhibit while he took a stroll about the grounds; and to show you, Mr. Editor, how ignorant some of our Vermont people are (only Vermonters are so, I suppose) about bees and the bee-business I will mention a few comments as I now remember them.

First person:

"What is that in those tumblers, Mr. M.?"

"It is extracted honey."

"Is it pure honey, are you sure?" at the same time giving me a peculiar smile, signifying a doubt.

"Yes, I'm sure that 'it is.'"

"What is it made of?"

"The bees gathered it from basswood blossoms."

"Did the bees put it in those tumblers?"

"No, they store it in the hive, and we then extract it."

Whereupon the method of extracting was explained to a large crowd that had gathered about us, to the entire satisfaction of the lady, who purchased some of the honey—at a good price.

Second person:

"Is that real bee's honey in those jars and boxes, sir?"

"Yes, it is."

"Well, a friend back here told me to come this way and I would see some of the new style of honey, such as they make of sugar and starch, and I suppose this is it. My husband keeps bees. He has six stands; but I know that *real* honey is not as white as this is; and, besides, I don't see any place where the bees can get in those boxes. We get our honey in the fall, when John kills the bees. We live over in the east part of the State. My husband says there is a man over here in this part somewhere that feeds his bees sugar, and makes lots of honey."

"Do you know the man's name?"

"No, sir, I do not remember."

"Is his name Manum?"

"Oh, yes! that is the name."

"Well, madam, that is my name, and I think I am the man you refer to."

"Well"—with a slight blush on her face—"do you feed sugar?"

"Yes, most certainly I do, in the fall, when the bees are short of honey for winter stores; but *never* for the purpose of having it stored in boxes, as

it would not pay to do so; and, besides, it would not be honey; it would be nothing but sugar."

She then turned to her boy, and said:

"Here, Johnny, come here; here is the great bee-man your father told us about. Have you written a book on bees, sir?"

"No; I never have, nor do I intend to; but here are some I will give you. They are published by men who know all about bees. Here is the *American Bee Journal*, published weekly, and here is *GLEANINGS IN BEE CULTURE*, published twice a month, and here are also two others, published monthly. You may take them home to your husband."

Third person; looking at a sample of foundation, and remarking to a friend:

"Oh! I know what that is. It is that yellow stuff the bees have on their legs. The bee-men make wax of it, and weave it into this kind of cloth for the new bees."

Fourth person, to a friend:

"Oh! look at the wasps."

"No, Jane, they are flies, and those things are a new kind of fly-trap. Oh, yes! I see now."

"Oh! look at that yellow stuff there. It looks like wax."

"No, Jane, it is soap, made into large cakes to show, and that there is also soap made into thin sheets so we can roll it up with the clothes to boil."

Fifth person, an old farmer:

"Are you the great bee-man? is your name Manum?"

"My name is Manum, and I keep bees."

"Yes; wal, I thought so, seeing all this honey and bees. Wal, I want my boy to learn to keep bees, for I hear you make lots of money with your bees, so I bought the boy a hive of bees last spring, but they have not done well this summer. He has watched them every day, but they don't swarm. That's why he did not come to the fair. He is at home watching the bees. They are all on the outside of the hive. It is so full of honey he says they can't get in, so he tried to put them in an empty hive, but they don't stay there, and they sting him terribly. I hear you charm your bees so they don't sting. Would you mind telling me how you charm them? I want to help the dear boy all I can."

"Yes, sir, I can tell you how I charm mine. I do it with one of these smokers. They are only \$1.00 each, and here are some bee-papers. Take them home to the boy, and subscribe for one or more of them, and let the boy study and work at the bees."

Sixth person, a practical bee-keeper:

"How do you do, Mr. Dodge? How are the bees doing with you this fall?"

"Well, Mr. Manum, I hardly know what to say. They are storing lots of honey, but it is dark-looking stuff, and I feel a little suspicious that the bees will not winter well on it. What is your opinion about it?"

"Well, I feel somewhat suspicious myself, and I thought I would extract the stuff from the center combs and feed 10 or 15 lbs. of sugar syrup to each colony, just enough to carry them through the coldest weather; and I did secure extra help last week, and started in with three extractors; but we did not work long before I changed my mind, and decided that this business would injure the bees more than the dark honey would; and even if I lose a few colonies by leaving it in, the loss may not be more than the expense of extracting and feeding

would be; so I have decided to pack them as they are, and run the risk. I have kept bees nearly 20 years, and never before have they gathered fall honey enough to winter on; hence I have had no experience with it. I have written, and sent samples of this honey to several parties who have had experience in wintering bees on such honey, and they write me that they would not hesitate to winter their bees on it, so I am going to try it, hit or miss."

A. E. MANUM.

Bristol, Vt.

Your decision in regard to running the risk, in your last paragraph, would accord exactly with my experience in this line. When bees have got poor dark honey—even honey-dew—sealed up and stored, just as it is wanted for the bees, I would let it be and take the chances rather than to throw it out and feed something else. If just before they go into winter quarters there is room in the combs where this dark honey has been used up, and we fill that room with sugar syrup, with a good heavy feed, so as to make every thing full all through the hives, it has never, in my experience, done any harm. In fact, I have had reason to think that the extra sugar syrup given them had many times come in so as to save them from the consequences that might ensue from using the poor dark honey just in the depth of winter, when a long cold spell happens to come.

POISONOUS SNAKES AND INSECTS OF THE SOUTH.

SCORPIONS, GRAMPUS, ETC.

IN compliance with the request of friend Walker and yourself (see page 769, Sept. 1st GLEANINGS), I contribute my mite. In regard to snakes, I would say I was born and raised about 50 miles north of New Orleans, La., and have lived here over two years. I have rambled over the woods on foot, both here and in Louisiana a great deal, being very fond of hunting, and I can confidently say I have seen more poisonous snakes in one week in Louisiana than I have seen all together since living in Florida. We have a good many harmless black snakes. I came across only one ground-rattler, and one of the large species, a small one, about 2½ feet long. A neighbor of mine, while out in the woods about a mile, killed a large rattler about 5 feet long. These are the only two I have seen here. I have killed two or three coach-whips here, but not one of them showed "fight." I have killed a few water-moccasins, here, but none of them showed fight until wounded. They would all run and try to get away. Large rattlesnakes are said to be quite plentiful down on the islands about 25 or 30 miles below here. A man living here killed one down there that measured nine feet in length, and had 20 rattles on him. As to the "grampus," they are also found on these islands. We have none up here. I have seen one or two dead ones, brought up from there. I inclose you a clipping from the *Bartow Informant*, a paper published something over 100 miles above here.

WANTED—A NAME.

One day last week we were shown an insect peculiar, we believe, to this portion of the country, and which, as far as we can learn, has no scientific name. It is known in Florida as under the various

names of "mule-killer," "scroncher," and "grampus," but is not mentioned in any book of natural history which we have been able to examine. A specimen, sent for name to the proper authorities in Washington, only elicited the names above mentioned. It is an insect about two inches in length, with huge mandibles, resembling those of a lobster, and long, pointed feelers, which might easily be mistaken for a fourth pair of legs. But the business end of the creature is represented by a slender terminal appendage which is held, like that of the scorpion, over the back. The sting from this is most severe, but not, as there seems to be a general impression, fatal. The insects burrow in the ground under rotting logs, and one can not be too careful when obliged to handle such things, lest they become suddenly and most unpleasantly acquainted with it. A specimen can be seen at Look's drug store.

I will make a trip to the islands shortly, and will endeavor to secure specimens of the "grampus" to mail you and Prof. Cook. I will also mail you specimens of the scorpions, a small stinging insect which hurts about as bad as a bee sting. They are found under the bark of dead trees, in lumber-piles, and trash of any kind. They are also very fond of hiding between hive-covers and the enamel cloth. I have been stung by only one. It is amusing to see how the mother carries her young. They all cluster on top of her back, and she carries them around until they are large enough to take care of themselves. I should have said I have killed several of those joint-snakes in Louisiana that would break all to pieces when struck, but I don't remember of ever seeing any blood. I have never seen one here. As to the specimens of snakes, I can not furnish any of them, as I don't like to handle them.

YOUNG G. LEE.

Charlotte Harbor, Fla., Sept. 6, 1889.

Thank you, friend Lee. Prof. Cook has told us a little about the grampus in this issue—see pages 849 and 856.

THE VAN DEUSEN METAL CORNER, AGAIN.

DECIDEDLY IN FAVOR OF 1½-INCH SPACING.

ON page 513 I stated that I was not fully satisfied in regard to the 1½-inch spacing of the Van Deusen reversible frame. Theoretically it seemed to me that, when such frames were full of brood, there would be a good deal of spare room between the combs, and that, when the bees should begin to use the brood-chamber for a store house, as they are sure to do when honey is coming just a little too fast for brood-rearing, and not quite fast enough to start them in the sections, there would be a broad area of elongated cells in the upper part of the frames that would ultimately cause me trouble. In this instance, practice has fully confirmed the theory. At the first appearance of honey in excess of the daily needs of the bees they proceeded to draw out the upper margins of the combs unless I happened to be on hand to reverse the frames often enough to keep brood constantly near the top-bar. This kind of vigilance may be all very well for the "fussy" bee-man, but it doesn't do for me. If I have to reverse all my frames every three weeks while honey-boards and supers are on, I will either go out of the business or adopt friend Shuck's hive, support it on two forked stakes, and attach a crank to it so that I may turn it over whenever I happen along. The honey-flow in my locality was barely sufficient to send the most energetic colonies into the sections, while the

laggards remained below and filled the brood-chambers to their utmost limit, crowding the queen until there remained for her merely an elongated oval in the center of each frame. In the course of time, the honey that had been placed below the brood by reversing was consumed; but the bees refused to cut down the elongated cells to a proper depth for brood-rearing, and they remained empty at a time when I could ill afford to have them so. Combs at the sides of the hive, full of honey from top-bar to bottom, are quite a good deal too thick for brood-combs. Since I use a contracted brood-chamber containing only 800 square inches of comb, I can not afford to have many square inches of elongated cells. It must all be brood-comb, and I see no way to obtain it and keep it so except by crowding the combs close together. One of my correspondents says he works his combs spaced 1¼ from center to center, and meets with no trouble except where there is drone comb. That is a little too close to suit me, but I want to be placed on record as being decidedly opposed to wide spacing. I have in my yard a dozen hives that are 14½ inches square, inside. They take a frame 13½ inches long and 10 inches deep. Two years ago five or six of these hives were left with nine frames—the rest with ten. This season not one of those nine-frame colonies went into the sections, while every one of the ten-frame colonies made a record in the supers. They were all populous colonies, and I could see no reason why those with nine combs were not in the sections unless it was because they had both store room and loafing room in the brood-chamber.

Aside from this one objection that I have treated thus at length, I think the Van Deusen metal corner beyond criticism. It works as well with an 8 inch frame as with the 7-inch; and when one learns how to handle it there is hardly as much danger of killing bees as with the suspended frame. I will not reiterate its good points, but simply state that, after thorough test, its mechanical workings have met my highest expectations. But its width must be reduced to 1½ inches, or I shall have to abandon it, much to my regret.

THE IOWA HONEY CROP; THE NON-READING BEE-KEEPERS CUTTING DOWN PRICES.

So far as I have been able to learn, eastern and southern Iowa has had an unusually heavy crop, while the western part of the State has had a virtual failure of honey, but plenty of increase. Now comes the exasperating part of the story: Iowa could easily have disposed of her entire crop at home at prices ranging from 15 to 20 cents per lb. for comb honey, and extracted at proportionate prices, had not the producers in the eastern part of the State gone daft at the sight of their own very modest crop. They seemed to think that, because they had obtained a little honey, the whole country was deluged with it. We in the west, with our one-fifth yield, were recovering a little of our lost ground by supplying a fair demand at 20 cts., when, without warning, we were flooded with honey that the grocers bought at 8 and 9 cts. per lb.—choice white clover and basswood in 1-lb. sections, all in splendid condition. Every one of these producers might just as well have had 12½ cts. as 9. All that was required was gumption enough to read and digest the reports in the bee-journals and the bulletins of the honey-producers' exchange. I have no sympathy to waste on them, but I greatly regret the shock they have given our market. The Iowa

honey crop is now mainly in the grocery windows, and will be pretty well cleared out by Christmas. After that the bee-men who have held on to what they produced will be sure to reap their reward.

Audubon, Iowa, Oct. 17, 1889.

Z. T. HAWK.

Your reasoning is good, and seems to be sound; and if in repeated practical tests it works as it has with you, it will prove a most important matter, especially in the matter of comb honey. I have worked hives with 11 frames instead of 10, in an ordinary Langstroth brood-chamber, 14½ inches wide. The combs had to be very exact, and those that did not contain brood had to be very thin. I presume likely, however, where we wish to crowd the honey into supers, 11 frames would be too many; therefore a dummy of one or more chaff-cushion division-boards would probably be an advantage.—We have seen something of the cutting-down of prices by the non-reading bee-keepers; but I think, friend H., this matter will correct itself in time. People are becoming better and better informed every succeeding year; and our county fairs are a great factor in getting people acquainted, and in getting them posted.

A LETTER FROM CHINA.

BEES UNDER THE PROTECTION OF A CHINESE INN.

FRIEND ROOT:—Last spring, while on a tour with Dr. Whitney, we stopped for dinner at a Chinese inn. On its right-hand side, facing out, was a bedroom, the front of which had sliding boards that came to within about four feet of the ground, thus making, when the boards were taken out, a broad window of the front. Even with the bottom of this window, a wide shelf had been extended out into the street, and the space below it inclosed with boards extending to the ground. Just under the shelf, at the inner corner next to the door of the inn, a stream of bees was pouring out and in from two cracks, one on each side of a board. The outer crack was quite wide; but the inner one, for only an inch or two at the top, was wide enough for bees to crawl through. The bees were all coming out at the wider crack, and, with but few exceptions, going in at the narrower one. I was interested in their docility; for though a number of persons were standing around, and continually getting square across their track, they made no objections. It was a real Chinese scene. The men went their way, the bees their way, each without noticing the other. As in several other cases like this, when I asked how they got the bees, I was told that they had come there of themselves. The query rises in my mind, Are Chinese bees more fond of human dwellings than are other bees? I thought last week I was going to have a swarm come to me like this, but they went to a drygoods box that Mrs. Whitney had set up, instead of coming to a nice Simplicity hive right from the "Home of the Honey-Bees."

POISON OF THE CENTIPEDE, AND THE USE THE CHINESE MAKE OF IT.

The Chinese are no chemists, and don't understand that the fangs of a snake or the nippers of a centipede can secrete poison from blood that contains no poison, and so they use the whole body. There is no reason for thinking that the centipede

taken internally has any virtue as a medicine. The Chinese think that, because tigers are so fierce and strong, eating their blood will make soldiers tiger-like; and I have several times seen men going about with a tiger's skeleton, peddling the bones by the ounce for a tonic.

ABOUT THOSE WASPS WHICH STUNG THE COOLIES SO UNMERCIFULLY.

As to our letting those poor coolies get stung, the whole thing was so sudden that none of us four, i. e., the Englishman, Scotchman, etc., got our wits together before the coolies were among the hornets. As I ran, I had thought, "How are our chairs to get past this? and won't it make trouble for passers by?" But I supposed that the coolies had seen the whole thing, and did not dream that they would come running after us as they did. I had been in China only a few weeks. When men, not used to bees, are attacked by angry wasps, they are not apt to see what is happening behind them; and when at a safe distance I turned and saw the other three still running, and the coolies rushing up from the other side, it was too late to stop them.

CHINESE SUPERSTITION; A DEMON.

As I was writing on the above, in came the cook, saying, "To-day they say, 'A demon! a demon!' Two of the stone-masons were down at the small river catching the duck that got away this morning, and one of them is drowned." Hurrying to the place, which is nearly half a mile away, I found that the body had not been recovered, and began to strip to swim to the place where the man had disappeared; but the Chinese exclaimed, "There's a demon in there!" All the more, of course, I swam and waded about the place (but I can't dive). The bottom of the stream was full of large angular boulders from the cliffs above. I found nothing, and neither did a boat which soon came up. Fear of the water-demon made the Chinese rather inefficient; but just before dark the body itself drifted down to shallow water and was recovered.

Now, just a few minutes after that man sank, three men on a long narrow raft of small timbers floated slowly past, and were entreated to stop and try to rescue him; but they would not. This was not heartlessness, but superstition—fear of the water-demon, which, they believed, had seized the man; and when that boat came, the first thing the man on it did was not to search for the body, but to chase and try to kill the poor duck, the "demon duck" I heard it called, which had been the innocent occasion of the misfortune. Yes, there was a demon there, the demon of superstition. I sometimes say to the Chinese, "You are greatly afraid of demons, and all the time are giving them free access to your hearts."

THE PHILOSOPHY OF THE FLYING OF INSECTS AND BIRDS EXPLAINED.

Why should the flapping up and down of a bird's wings propel it forward? Many of us have seen a boat propelled by working an oar back and forth at the stern, and all our ocean steamers are driven forward by a screw revolving in a plane at right angles with the course of the ship. All three kinds of propulsion—wings, sculling oars, and screw propellers—are different modifications of the same thing, the inclined plane. Did you ever notice one striking thing which characterizes the wings of all flying things, whether bird, bat, or insect—namely, that, while the stems of every thing else in nature are placed centrally, wings are always more or less

one-sided, with the shaft in or near the front edge? As a consequence of this, when the wing descends, the back edge turns up; and as it ascends, the back edge turns down, and thus always presents an inclined plane to the air, which, as it sweeps up and down, propels the bird forward. To illustrate the way the wing works, take a small stick about ten inches long, and slit both ends in the same direction, to the depth of about four inches. Then take two pieces of stiff writing paper, each about $3\frac{1}{2}$ inches square, and fasten one, by one edge in each slit, so that they will project on opposite sides, thus: Now stick a pin in the center of the stick, perpendicular to the plane of papers, and, taking this between the  thumb and finger, hold the toy either face upward or downward, and swing the hand up and down. It will spin around like a windmill, and it will always turn in one direction; i. e., away from the free edges of the papers, no matter in what direction the hand may be swung.

The Chinese at Foochow have a scull for propelling boats, the sides of which are too high for rowing. It is a sweep a little concave on the under side; and near the center, a hollow fits a short round-headed pin, which projects from the edge of the stern, and forms with it a ball-and-socket joint. The scull extends down into the water at an angle of about 45° ; a rope is fastened tightly around the upper end, and tied to a hook in the deck below. The boatman grasps the end of the scull with one hand and the rope with the other; and as he pulls and pushes back and forth, the one-sided strain from the hand on the rope turns the blade of the sweep now this way and now that, to the proper angle, as it plays back and forth in the water. It is a wonderfully simple and effective device; and in this matter of making it self-adjusting by applying the force a little to one side instead of directly in the center, it is just like a bird's wing. I have no authority for this theory of a bird's flight except my own observation; and if any one has a better one to propose, I should be glad to hear it.

Shaowu, China, Aug. 12, 1889. J. E. WALKER.

We are much obliged to you for your exceedingly vivid illustration of the effect of superstition. The poor heathen left the drowning man, to chase after an innocent duck. Now, the saddest part of it is, that such ignorance and superstition are not altogether confined to heathen lands. A milder type of the same malady exists in almost every neighborhood. Listen to the conversation of ignorant and uneducated people—people who do not read the papers—and you will hear more or less of it.—I am exceedingly obliged to you for your kind explanation of the philosophy of the way in which birds and insects fly; and I confess that the thought never occurred to me before. Why, you have even given us an idea of a windmill that would run in the same direction, whether the wind blowed on the back side or front side, without any vane to turn it around. In regard to insects, I can readily understand from your explanation how the movements of the wings should propel the bird or the insect forward; but I do not exactly understand why it should cause them to rise, unless the head be elevated a little higher than the tail; or if the tail be bent downward at an angle while the

wings propel forward, this would cause the body to rise; and I think I now understand why a hawk rises with comparatively slow flapping of its wings. It seems a little funny that I should have to go to China for a scientific answer to so simple a question.

INTRODUCING.

GIVING A QUEEN TO A COLONY AT ONCE.

THE queen arrived all right, and I am very much obliged to you. You sent a small circular with the queen, telling how to introduce her, by the Peet process, to a colony of bees. I have lost queens the very same way you give directions to introduce. I will tell you how I introduce a queen, and I will warrant you will never lose one. I do not make a colony queenless until I get the queen I am going to put in. I take the cover of a Langstroth hive, and set it down on the ground, and put two small blocks under two corners of the cover, to raise it up so the bees can pass under. I then lay a paper down on the ground in front of the cover, and commence to shake the bees off from the frames until I come to the queen. I then cage her, if I want to save her; if not, I pinch her head off and then I keep on until I get all the bees off the ten frames in front of the cover. The bees will run under the cover, and cluster. Take the frames the bees were on, and put them in the hive and put a cloth over them, so the brood won't get chilled; then pick up the cover, the bees have clustered under, and give it a hard knock on the ground over the paper. Then take a small sprinkling-can and give them a little sprinkle of water. Open the cage the queen is in, and drop her in the pile of bees. If the bees go to fight her, give them another sprinkle and they will be glad to let her alone. The cover must be set down where you had it before, so the bees can run under and cluster. The bees and queen will be hanging to the inside of the cover. Take the cloth off from your brood-frames; now pick your cover up that the bees are under, and give it a knock over the frames very hard, to knock the bees on the frames; put your enameled cloth on, and cover. Set your hive where it was before, and I will warrant your queen will be laying in a few hours, if she was a laying one at first.

You may think this is a great deal of trouble; but I can do it in three minutes. Is this not better than to wait 48 hours? and even then you may lose your queen; and you will have to wait three days before she commences to lay. I united two colonies together that had good laying queens, and put in that imported one you sent me last Thursday. She is laying, and all right. I have introduced 20 this fall the same way, and have not lost one.

Buffalo, N. Y., Sept. 30, 1889.

F. M. JONES.

I hope you will excuse me if I remind you that, although you have introduced 20 queens without loss, you are very likely to have a great many losses with the next 20. The plan you give is old, and has been thoroughly tested. Another thing, it would be nothing strange if nearly all the 20 you mention would have received the queens all right had you just taken out one and put in another. One fall, when we had some queens to destroy, because they were hy-

brid (this was long ago, before there was a market for hybrids), we experimented with them by swapping. We opened two hives at the same time, and traded queens, picking them right off from the combs, and putting the others right in their places. I was greatly astonished to find that the greater part of them went right along to work in the new hives just as well as in their own. This may be astounding to a good many. We tried it in good weather, when the bees were peaceable and quiet. I believe this can be done safely in the majority of cases; and this fact accounts for the great number of processes for introducing queens. The inventor of these processes often feels sure that he has made an important invention, simply because he has introduced a good many queens by his plan and had no trouble. One more instance: Neighbor H. once had a very prolific hybrid queen that he did not value, simply because she was a hybrid; therefore he for quite a time practiced moving her from one hive to another in order to get said hives filled with eggs and brood. He just set her right on the combs without any caging, and she was thus moved from hive to hive for quite a time without injury.

QUEEN AND DRONE IN COPULO.

VALUABLE TESTIMONY BY AN EYE-WITNESS IN THREE CASES.

PROFESSOR COOK asks for further proof that queens while in copulo drag the male bee along the ground. I have been a close observer of the busy bee since I was a boy of 12 years. It is nearly 33 years since I had my first swarm. I have witnessed the mating of but three queens in all that time.

In 1883 I gave a mature queen-cell to a small nucleus of about 100 bees. With so small a nucleus I could more easily see the queen go out and return, and could witness her maneuvers better. On the eighth day after emerging from the cell she came forth arrayed for her wedding-trip, about 4 p. m. She went through the general maneuvers to locate her home, then flew away. I could follow her with the eye for some time, as she hovered over the apiary. In eight minutes she returned without accomplishing her purpose. Next day she came forth at 2 p. m. There were thousands of drones flying at this time. She slowly circled over the apiary a while, about 15 feet high. Three or four drones followed. They finally clinched, and gradually settled to the earth, dropping into a piece of sweet corn in the garden. I was there as soon as they dropped. The queen had clung to a fallen corn-stalk, while the drone was trying to get away. They finally separated, the drone dying instantly. I went back to the hive, and in about two minutes the queen returned, with the drone organs attached. The bees on the alighting-board spread their wings in glad delight that she had returned. I gave them two frames of hatching brood, and two quarts of baby bees. In five days I opened the hive to see how they were prospering. The queen's body was distended to an enormous size, but not an egg had she laid. She seemed to try hard. I caught her and held her between some cotton batting, and gently pressed on it. Her lower extremity grad-

ually distended, and I could see a small gummy substance, which I removed very carefully with a pin. In seven days I looked again, and the hive was full of eggs. This was a daughter of the imported queen I bought of A. I. Root the same spring.

The next season, as the prime swarms came off I would take them in three or four days afterward to an out-apiary just four miles away. I noticed where the hives had stood containing the queens of the imported stock. Many bees came back with their legs full of pollen, but no bees from other strains of Italians came back. That convinced me that the newly imported stock was stronger of wing, and had been nearly to my out-apiary after honey before being carried there.

Again, this past season, 1889, I was passing a hive, No. 29, which contained a very prolific queen one year old. What should I discover but two bees slowly settling downward, going over and over? When they got on a level with my face I saw it was a virgin queen and a drone. The queen was trying with all her might to gain the entrance of the hive, and the drone was going the other way with all his might. The queen being the stronger, she drew him down to the alighting-board. She grabbed on with her feet, crawling toward the entrance. They then broke apart, the drone dying instantly. I supposed I had lost my queen in 29; but on opening the hive, not an egg was to be found—all sealed brood. The old queen was there, but her body was uncommonly distended. I caught her and pinched her head, and opened her body. It was filled with a yellowish fluid. She would never have laid any more, as I had kept one several years ago in the same condition. In due time the young queen commenced to do her duty.

Two days before basswood ceased to yield honey, as I was passing a hive I noticed a large bee trying to fly from the alighting-board; but every time she rose two feet in the air, down she came again. It proved to be a virgin queen. Her wings were too short to carry her body. They were perfect in every way, with the exception of being shorter than the wings of a virgin queen usually are. She would get perhaps four feet from the hive, and crawl back into the hive, and immediately come out again and try again to fly away. I watched her maneuvers for two days. I then thought of a plan to have her fly and not get scared by handling. I made a cone of wire screen around the hoe-handle, a foot in length. I plugged up one end, and tied it to the tip end of an 18-foot cane fish-pole. At two o'clock, when thousands of drones were flying, I gently dropped her into the cone and quickly raised it high in air, and kept watch of the tip of the pole. In about two minutes she took wing and slowly circled over the apiary, gradually settling downward. When within nine or ten feet of the ground, several drones rushed after her and clinched and immediately dropped to the ground. I was on hand instantly. The queen and drone were in a seemingly deadly embrace. After two or three minutes they tore asunder, but the drone died instantly. The queen I returned to her hive, and in due time she filled her hive with brood. I had supposed this hive had a fine queen; but on opening it not an egg could be found nor sealed brood; every cell was full of honey. I removed combs of honey and gave empty combs. The old queen must have been gone some time; no knowing how long the

young queen had been trying to take her wedding-trip; but by elevating her in the air she finally succeeded.

J. R. REED.

Milford, Wis., Oct. 7, 1889.

You give us some very conclusive facts, and some very *important* facts also. Your last experiment reminds us of the way we fussed with virgin queens at the time when there was such an excitement about artificial fertilization. I have tossed queens up into the air, when their wings were poor, hoping I might be successful, as you were with your fish-pole; but your queen could almost fly, and you gave her such an elevation that it succeeded, I presume by accident. I believe we have had reports before of results strikingly similar, but none quite so direct and positive as those you give.

A FLORIDA BUGBEAR.

POISONOUS INSECTS: BY ONE WHO HAS BEEN AMONG THEM.

THE deadly black grampus, referred to by your West Virginia correspondent in your issue of Sept. 1, page 709, must be a terrible fellow. He is variously called "scorpion," "whip scorpion," and in this region they are called "mule-killers." He is not a handsome beast, and has a bad reputation. Native Floridians, both white and black, generally regard its sting as deadly as the fangs of the rattlesnake.

It has a caudal appendage, needle-like in appearance, about two inches long, that is thought to be its deadly sting. The entire length of a good-sized specimen is about six inches. The palpi, or feelers, are much enlarged by a claw at the extremity, much like that of a crab or lobster. Its color is black. Its abdomen is prominent, like a large spider's, but much longer; and when disturbed or attacked it emits an acrid and offensive odor. It is

quite abundant in this region, and I think it is common in all the warmer parts of the State.

It is said to inhabit the southern part of Texas as well as Mexico. Its scientific name is *Thelyphonus giganteus*. It is allied to our common scorpion, *Buthus Carolinianus*, which also has the enlarged feelers and crab-like claws, and probably because of this resemblance it is erroneously called a scorpion. I had been at work upon our homestead several weeks before I saw one. In turning over a rotten log we found him. I was duly warned by my assistant.

"Look out, boss, that varmint's deathly pizen. They call him mule-killer, but he is a reg'lar man-killer. If he stings you, you die in two hours."

But being of an inquiring turn of mind I decided to investigate the "varmint." I did not at once pick him up in my fingers. He was an ugly-looking customer, and seemed well armed at both ends. Being touched with a small stick, he at once faced the enemy, elevating his feelers and opening his pincer-like claws, ready for battle, at the same time emitting an acrid and offensive odor. I next held him down with the stick, which he tried to grasp with his claws, but made no use of its sting but to keep it in an elevated position. The outcome of the matter was, that the terrible *bear* proved to be a harmless *bug*. The common scorpion is also much of a bugbear, as many believe its sting is fatally poisonous. It has a sting, and uses it at every opportunity; but its sting is less serious than that of a bee or wasp. It is very painful for a few minutes, but does not swell, nor become inflamed.

The grampus is an insect-eater, and a particular enemy of the cockroach, the great pest of the Florida housekeeper, and it should be regarded as a friend rather than an enemy. By this mail I send you a specimen about two-thirds grown. I hope it will reach you safely. Perhaps I should say, I have been in Florida fourteen years, and am very familiar with these insects. I have killed many scorpions, but never a grampus, purposely, until the one I send you. I have often been stung by scorpions, but never could coax a grampus to use its sting. Indeed, the poor fellow doesn't seem to know that he has a sting. When viewed under a microscope of moderate power, the structure of its tail is clearly seen. It is composed of joints, in appearance much like a scouring-rush, and covered with scattering hairs.

JAS. H. WHITE.

Island Home, Fla., Sept. 20, 1889.

The above came to us after the article and drawing from friend Cook had been put in type. We are very glad indeed to have a corroboration of the fact that these creatures are innocent and harmless. In fact, the superstition connected with bugs and innocent reptiles reminds us of the demon duck mentioned by our friend J. E. Walker, in his letter from China, in this issue. On our grounds I find it almost impossible to persuade the boys and men that the common streaked snake is not dangerous. Even where they have been found close by a Hubbard squash-vine, doing duty in protecting the squashes, the men can not let them alone. I am quite sure that, if no one would chase them with clubs and stones, I could get them as tame as my Brahma chickens. We can afford to take some space in GLEANINGS to find out that many of God's creatures which have been

pursued for ages as enemies are only harmless friends. Yes, more; that they have been laboring diligently for us for ages past.

FUMIGATING HONEY.

DR. MILLER TELLS WHEN AND HOW TO FUMIGATE WITH BRIMSTONE.

SO much has been said lately about brimstoning honey, and the plans in general are so troublesome, I am now tempted to give my way, although I have given it before. It is a very simple matter. Just get some powdered sulphur, light a match and set fire to it, and that's all there is of it. No dipping rags in sulphur, nor any preparation whatever. Within two minutes after the sulphur is brought from the store I can have it slowly blazing away, needing no further attention till the last atom is consumed. Although there is scarcely any trouble about this, I take some pains to avoid any danger from fire. Let me give you the minutiae of my last experience, which does not materially differ from that of several years. We were getting our crop of honey ready for shipment; and trusting somewhat to what I had read of the experience of others, I had said, "This honey has all been taken off so promptly, is so white and nice, and there is not one section in a thousand with a cell of pollen, that I don't believe there is any need of smoking it." But after scraping a good many sections we began to find here and there the tell-tale bits of powder that showed the little worms were at work there, even though we could not see them with the naked eye. So we concluded the remainder must be smoked before any more were packed in cases.

I said to my wife and Emma, "Now don't let me ever again omit fumigating. Those who say there is no need of it have different bees, or something different from mine, and it is just possible that, if they watched the matter closely enough, they would find some of their sections are wormy before they reach the table of the consumer."

So I got a pound of powdered sulphur. The roll brimstone is cheaper, but a great deal more troublesome to burn. The sequel showed that a pound was not enough for so large a room; and, to tell the truth, I don't know what is the right amount. If too much is used, some of the sections are made green; and even with too small an amount used, a few sections were slightly greened. It must make some difference as to the amount of honey in the room. Suppose you have a room measuring ten feet each way, and you find just the right amount to sulphur a single section, will it not require a less amount when you fill the room just as full as you can with sections? When the room is about empty, if it contains 1000 cubic feet of air it may be filled so full of honey that it shall contain less than half the air; and are you not to gauge the needed amount of sulphurous vapor by the volume of air to be saturated? If the honey is smoked within ten days or two weeks after leaving the hives, much less sulphur will answer than a month later. After the worms have attained full size it seems almost impossible to affect them with any amount of sulphur.

But, to return. I have an old kettle, worthless for ordinary purposes, which is placed on a dripping-pan turned upside down. The kettle has a capacity of perhaps 16 quarts, and is filled a quar-

ter to a third full of ashes. On these ashes stands another kettle of much smaller dimensions. In this latter I put the pound of sulphur. Making a kind of little dish in the top of the pile, I stuck in it a lighted match, and at once there was a little melted puddle on which a blue flame was playing. I covered over the whole affair with a worn-out milk-pan, both for greater security against fire, and so that it would burn more slowly. It was placed near a window, so that I could look in and see what was going on. The sulphur was lighted at about six in the evening. At 10 P. M. a line of blue could be seen burning away under the edge of the milk-pan. I then went to sleep and did not look at it again till 12, when it had burned out. Next morning, doors and windows were opened some time before the room was aired out fit to breathe in.

ROBBER-CLOTHS.

Friend Root says he didn't see any robber-cloths when here. No, we didn't need any; and, indeed, robbers troubled very little this year. Still, we did need them later in the season, and they were then used, but not very much. In the revised Langstroth, Dadant & Son include among "the utensils needed for neat extracting on a large scale," "two robber-cloths." Although I believe the robber-cloth is my own invention, I am always glad when it is not needed.

C. C. MILLER.

Marengo, Ill.

Well, doctor, if I had found evidences of worms in the sections, as you did, I should, without question, resort to the sulphur fumes; but so many have of late said they did nothing of the kind, and never saw a moth worm anywhere about the whole crop, that I had begun to think it was not necessary; and even now I do not believe I should think of fumigating until I saw some evidences of the moth worm. I would, however, keep an eye on the crop for several weeks after it is taken from the hive.

THE REESE CONE BEE-ESCAPE.

AN IMPROVEMENT.

I AM now using with great success and pleasure my bee-escape made wholly of a flat board and a single cone. The board is just the size to cover the T super or surplus case, and may have bee-space or half bee-space above or below, or both, as needed, and the 2-inch hole is put through the board at such a point that the cone will fit down into the lower or unfinished case of sections. When you have taken one section out temporarily, and this point will be determined by the width of section used, this cone may be about 3½ inches long, and is easily made from a piece of wire cloth 6 inches square, by turning a piece of hard wood to about the shape desired, as a form, and shape the cone over it. The cone may be at-

RESE'S SIMPLIFIED
BEE-ESCAPE.

tached to a piece of thin board with a hole in it, instead of the board direct, so the cone may be easily taken off, and all snugly stored away for next season. Now, to take off the last case of sections at the close of the season, just place an empty super over the brood-chamber; lay the escape board on, with cone down, of

course, and set the case of honey on top. The few lurking bees that will remain in the top case will all be old ones, and will not show fight when you remove the cover, but will be glad to fly back home.

In this empty case over the brood-chamber, when no honey is coming in between the spring or early summer flow and the fall flow, you will find the bees will cluster very quietly, and be out of mischief. This last plan will not get the bees out quite so clean as the first plan I wrote you about some time ago, but it has the advantage of forcing the bees into the empty case of sections at once, and giving them no empty space to cluster and build comb in the case that would contain the cone. I have been rather persistent in presenting to you and the public this discovery; but I know very well its merits, and it is cheap (no patent and no booming). Try them.

J. S. REESE.

Winchester, Ky., July 16, 1889.

We are greatly obliged to you indeed for your repeated hints and suggestions in this matter of letting bees go in but not come out, or, vice versa, letting them go out but not come back again. Your arrangement fills the same place in bee culture that a valve does in a pump. It lets the water go one way, but not the other.

ITALIANS BITING THROUGH THE COROLLA-TUBE OF THE TOUCH- ME-NOT.

MORE POSITIVE TESTIMONY OF THE CORRECTNESS
OF THE STATEMENT IN THE A B C.

WHEN I first perused the A B C book, I was rather skeptical in respect to the truth of the article where the author describes how he witnessed bees biting through the corolla-tubes of the touch-me-not flowers; and when, at a later time, Prof. Cook said it was all a mistake, and that he could teach another professor that "honey-bees do not bite through the corolla-tubes of flowers" (GLEANINGS, 1888, p. 926), I was, I am sorry to say, rather pleased to know that A. I. Root was at least once wrong, and not so infallible as I had thought him. But now I am not so ready to believe that he was mistaken after all, as he was to admit that he might be.

This fall I happened to enter a swamp, and I was surprised to find a great number of bees at work on the touch-me-not, which was very abundant. There was not one bee alone, but thousands; and you may imagine with what interest I watched them at work, that I might know the truth for myself. I saw but one bee enter a flower, and I thought he looked a little foolish when he managed to scramble out again, and I did not see him try the same experiment the second time. Almost all the flowers had holes bitten through the corolla-tubes, about $\frac{1}{8}$ of an inch from their ends, and the bees flew to them directly. I had a good view of two or three in the act of biting through the tubes of the younger flowers. There were several small bumble-bees and a few wild bees at work, but they all entered the flowers in the regular manner. These were all the insects I saw at work on the touch-me-not, but I was much interested by seeing a pair of humming-birds, dressed in the brightest of green and bronze, darting from flower to flower, and, passing with rapidly whirling wings, sip with their

long tongues the nectar from the deepest depths of the flowers. From what I witnessed, I know of at least one person whom it would be hard to convince that honey-bees do not sometimes bite through flowers to reach the nectar.

In this same swamp there were many thistles—great, lusty, tall flowers, as tall as my head—"bull thistles" we call them, and the Italians were working upon them with a vim. I mention this because I see no mention in the A B C of the thistle as a honey-plant.

F. N. HILTON.

Pontiac, Mich., Oct. 12, 1889.

I am very much obliged indeed for the compliment you pay me, and I hope that you and I are correct in the matter—not because I want to get ahead of our good friend Prof. Cook, but because I should be very sorry to know that any statement I have put in the A B C book is a blunder.

PECULIAR HONEY.

IS IT HONEY-DEW, OR WHAT IS IT?

MR. G. H. KNICKERBOCKER, Pine Plains, N. Y., sends me what he supposes to be "honey-dew." He says his combs are from one third to one-half full of such honey.

He desires my opinion as to its fitness for winter stores in this severe climate. He further states, that, were he sure this would be fatal to his bees, he would take them to Florida.

The honey was sent in the comb. It was quite dark, and the taste was so exactly like that of figs, that, had any one put it in my mouth, without my knowledge of its origin, I should have said unhesitatingly that it was figs. Two of my students said the same. One of them said, "It is the most delicious honey that I ever tasted." If this is "honey-dew," it is a very different kind from any that I ever saw or tasted before. As I have written our friend Knickerbocker, I should cast about for some jelly-factory, or other source of fruit-juices, as the source of the nectar from which this honey was derived. I have some very fine fruit honey that tastes very much like quince jam; and this honey made me think of my fruit honey at once.

As to Mr. Knickerbocker's question, let me say that our friend Manum, of Vermont, and several others, have sent me some very pleasant honey, with a like question as to its fitness for winter. All suppose the honey to be honey-dew. My opinion is, that any honey that is agreeable to us, and which we are willing to place on our own tables, is safe for bees. If it is bitter, and unfit for our larder, then it is hazardous to give it to the bees. I have taken as nice honey as I ever saw, from nectar which the bees gathered from the larch plant-louse. Such honey would be ranked No. 1 in any market. I used it very successfully as winter food for our bees. I wish very much to get samples of all such honey. I shall prize greatly some of this from Mr. K.

A. J. COOK.

Agricultural College, Mich., Oct. 14.

Friend Cook, I am glad to see you say something favorable in regard to honey-dew. If honey is good, I should eat it without asking why or inquiring where it came from, providing, of course, it produced no deleterious effect; and I believe the honey-bee has all the apparatus needed to make fit

for human food any thing which they decide is fit to be placed in their hives. Of course, this remark would not include poisonous substances used to kill insects, etc. Whatever nature furnishes, and the bees gather and store in their hives, I think is, as a rule, fit for food. I should be careful about discarding any honey that is nicely ripened and sealed up.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

AWAY FROM HOME WITHOUT YOUR BIBLE.

I am much interested and refreshed from time to time in reading your pieces for Our Homes, and have been especially struck to-day with what you say on page 751, respecting the difficulty you experienced in getting a Bible. I remember about two or three years ago, when going from home to visit some relatives for a few days, my bag being rather closely packed I omitted taking my Bible, thinking there would be no difficulty in getting three or four if necessary; but to my surprise and grief I found I caused some unpleasantness in getting the loan of one to take to chapel with me on the Sunday morning. It taught me this lesson: Never to leave my own "Sword" at home again, and expect to borrow from others. It reminds me of the ten virgins saying, "Give me of your oil," and getting refused, while we are gone to buy oil (or a Bible). We may lose the opportunity for using it. Better leave our night cap or Sunday bonnet at home than our Bible.

My other half is known as "Amateur Expert," so you had better put me down as

Yours sincerely,

MRS. A. E.

I am exceedingly obliged to you for your very kind words. The parable you refer to (the ten virgins) surely does seem to hit the point exactly. Since that time, when I have been away from home I have been provided as you suggest.

SUGAR-MILLS IN THE SOUTH.

I have left my little farm, and am at work on the Valley R. R. as fireman. It is funny to see the planters cutting cane in one part of the plantation, and planting it in another. They start to make up the cane this week; from the top of a telegraph pole I can see a dozen or more sugar-mills. An immense old brick mill is going to ruin. The roof had tumbled in on one part. The appliances were behind the times. It has not been used since the war. Although it was Sunday, three men came from the swamp, with a fawn. I have not seen GLEANINGS in three months; but the queen-bee at home reads it.

R. R. WILLIAMS.

Baton Rouge, La., Oct. 16, 1889.

MOVING A WHOLE APIARY WITHOUT A SINGLE ACCIDENT.

I moved my whole apiary, of about sixty colonies, without a single accident—not a comb broken down. I moved them on a wagon without springs. I put about 6 or 8 inches of hay in the bottom of the body, and I think it better than springs. I have no fall honey, as we have had too much rain.

J. W. MARTIN.

Greenwood Depot, Va., Oct. 5, 1889.

ANOTHER COLONY OF BEES LIVING AND PROSPERING IN THE OPEN AIR.

I send a rough pencil-drawing of a swarm of bees which I took from the under side of an oak limb about three inches through, where they had begun building their home. The tree stood on my neighbor's place. He found them about two or three weeks before I got them, August 20. They could not have been there long before he found them, for he passed the place nearly every day. They had

A COLONY OF BEES IN THE OPEN AIR.

three cards of comb, about 6 x 9 inches, and a narrow one besides. They had no honey, and not much brood. I think the swarm was small, because there was not much honey to be had at this season. I have heard of such cases in California, but this is the second case I have known of here. I send the drawing, thinking it might be something of a curiosity. It is not a common thing. If any one else has seen the like, I should like to hear about it.

Sarasota, Fla., Aug. 21, 1889. JOSEPH COSTELLO.

THE FOUNTAIN PUMP, AND HOW TO "DOCTOR IT."

My fountain pump does not work very well. It catches, and the pitman will not move readily. Then when it does go it goes with a rush. I have tried to get the thing apart to see what is the trouble with it, but have not succeeded. I want to take it to Cuba with me, to use in swarming time; but I should like to have it work all right. Can you suggest a remedy?

A. W. OSBURN.

Dehesa, Cal., Sept. 3, 1889.

P. S.—Hold! Since I wrote the above I have fixed the pump. I took off the nozzle and poured the pump full of castor oil, and now it works like a charm. No charge for this.

A. W. O.

The above is an extract from a letter of friend Osburn's. As others may have experienced a similar trouble, we give it to our readers.

NOT YELLOW QUEENS, BUT QUEENS FOR HONEY.

It turns out that the yellow queens that we have been paying such a bountiful price for are only second or third class queens for the production of honey. Well, that is just my experience; and the decision of that question in GLEANINGS will produce a revolution in the queen-business.

La Otto, Ind., Sept. 25, 1889.

E. S. HANSON.

We don't deny but there are nice yellow bees that are likewise good honey-gatherers; but the tendency on the part of queen-

breeders has, we fear, of late been to make too much prominence of color, and at the same time sacrifice every thing else for it—real business being a secondary matter.

A COLONY TOO LARGE.

I have a swarm of bees in an eight-frame Simplicity hive. I think the swarm is too large to winter in the lower story. Will it be all right to leave a T-super crate on during winter, nearly half the boxes being capped? I winter in the cellar. I don't care to divide the swarm, as all of my hives are full of bees from top to bottom. This swarm has made three crates of capped honey since August 16, a good per cent of it being from second-crop red clover grown for seed.

F. B. DAY.

Pittsburg, Mich., Sept. 17, 1889.

Leaving the sections on top will answer just as well, and, in fact, some years ago a great many reported having had better success in wintering where the sections were left on all winter than where they were taken off. I never saw a swarm too large for wintering, or summering either, in my opinion; but I think I should leave the extra-powerful colony out in the open air, unless, indeed, you have a cellar well ventilated and pretty cool. Be sure they have stores enough. If there is any doubt about it, perhaps another story filled with combs of honey would be safer, especially as your hives are only eight-frame. Of course, it will cost something to winter such a colony; but my experience has been that, when wintered, they are worth two ordinary colonies, and sometimes even three.

ASTERS.

The aster is just in bloom. It would do you good to see the bees on the flower, and watch their lively movements among the flowers. If it continues as it now is, dry and warm, they certainly will fill up their empty combs, for there is a good part of these combs empty. I have had very little surplus this season. My bees have not stored it. Last fall there was as large a supply of aster as I ever saw; but the weather was so cool and wet that bees actually did not get one good day to work in during the aster season, though they worked some a good many days, but did very little good.

DR. W. S. JONES.

Central Station, W. Va., Sept. 15, 1889.

HOW TO FEED POULTRY.

According to my judgment you ought to tell your subscribers that poultry pays if properly managed. Nine-tenths of the drawbacks are due to lice. Why not clean out the poultry-house every week (every day is better)? thoroughly saturate with lime and kerosene oil, and have your houses free from draught and dampness. Save the corn, and feed to some stock that you wish to fatten; feed wheat and oats in the evening; in very cold weather a little is well enough, and mess food in the morning, with a little cotton-seed meal during moulting season. As a rule, the best beefsteak at 16 or 18 cents per lb. is cheaper food than corn at 50 cents a bushel. Procure some good clover hay for your fowls in winter time, for green food; scald it, cut fine and mix with a little wheat bran or middlings. This makes the best morning mess. Have some broken glass or china ware before your hens, as grit; feed regularly; use common sense and prevention, and I can honestly say you can make

poultry pay; and for those that have common flocks, if they procure thoroughbred males every season they can greatly improve their stock.

DO BEES SLEEP?

I never read when and how bees sleep. How is it? Kulpville, Pa., Sept. 11, 1889. A. H. ANDERS.

So far as I know, bees do not sleep. Will Prof. Cook please tell whether I am right?

MY IDYL.

Each poet sings of his ideal fair,
Her charming ways and beauty rare,
All vieing with their utmost zest,
To make their own appear the best.
But I've a beauty in my mind
I'm sure outrivals all her kind.
Her form, her face, her very air,
Her — my pen can not describe her hair.
Ah! though I prove inadequate
Upon her beauty to dilate,
All who see her must agree
That she's as "sweet as sweet can be."
And when I note the fair address
Of this great treasure I possess,
Perhaps my actions do imply
That I am badly "gone" on her.
But though I'm voted quite a bore
For boasting her that I adore,
I hope that all will quite excuse
Each silly adjective I use;
For, though to beat, one oft contrives,
She's the fairest queen in all my hives.

J. H. MARKLEY.

Carbondale, Kan., Sept. 9, 1889.

GETTING THE BEES OUT OF THE SECTIONS WITHOUT A BEE-ESCAPE, SHAKING OR SMOKING.

In a late issue of GLEANINGS I read your footnote to an article commendatory of the Reese bee-escape. I have not had experience with the Reese implement, but I have experienced trouble in getting rid of bees in supers when removed from off the hives. This season I discovered how it can be done skillfully, and no trouble. Just as the shades of night appeared, I removed three supers, tiered one above the other from a hive, and set them near the entrance of another hive. Each super contained 28 one-pound sections, which were filled with honey; and when I removed them (the three had been tiered up by placing the second on top of the first and the third on top of the second) I set the load down where I stood, and allowed it to remain there until I was ready and had assistance. When I went to remove the supers I discovered the bees running in a mass from the bottom of the removed supers into the hive close by. I then loosened the supers from each other, and so placed each one in front of the hive that they could run into the hive; and by smoking the bees in the supers they all went into the hive.

Since the experience related, I have practiced removing supers in the early evening, and setting them down until the bees have time to realize they should and do prepare for an emergency by filling themselves with honey. I then place the supers in front of the hive, so situated that the bees can readily go from the super into the entrance of the hive; smoke the bees till most have left the sections, and let the super remain until about daylight, when all or very nearly all the bees have found their way into the hive. I have removed supers from the hive, set them in front of another

colony, and the bees went from the sections into the stronger hive. Why I did so was because I wanted to strengthen the colony. I do not dread removing sections from hives. Try my way of separating bees from filled sections. C. J. ROBINSON.

Richfield, N. Y., Sept. 20, 1889.

I believe, friend R., that all you mention has been many times mentioned in our journals, and the plan of setting the super near the entrance over night is in common use, at least to a considerable extent. But your idea of strengthening weak colonies with bees from sections of honey is, so far as I recollect, new. Although we are not so likely to have weak colonies when we are taking off section honey, it sometimes happens that we want to strengthen nuclei; and bees coming into the hive or nucleus from a crate of section honey would be pretty sure to be well received.

JAPANESE BUCKWHEAT IN FLORIDA.

The Japanese buckwheat I got from you last April gave me such satisfaction that I should like now to get some cabbage seed for winter growing here. We are now sowing the seeds for our winter vegetables. I have the fourth crop from the buckwheat got in April, now in bloom. It has planted fully an acre the fourth time. It has done remarkably well, and every one who sees it admires it, as it is quite a new thing in this section.

C. K. MACQUANIE.

De Funiak Springs, Fla., Sept. 29, 1889.

DOES COPULATION OF BEES TAKE PLACE IN THE AIR OR ON THE GROUND?

GLEANINGS for Oct. is at hand. I see that Prof. Cook has some doubts in regard to the bumble-bees mating when they were on the ground, instead of mating while in the air. I am positive that copulation had not taken place when I first saw them, and that it was accomplished while on the ground. If the queen bumble-bee can not sustain the weight of the drone while on the wing, it is quite certain that the queens of our honey-bees can not, as the drone bumble-bee is considerably smaller than the queen, while the drones of our honey-bees are as large, or larger, than the queens.

C. M. WOOLVER.

Richfield Spa, N. Y., Oct. 7, 1889.

THE BOY BEE-KEEPER AND THE CHURCH HIVE.

These labels are for my little 12-year-old boy, who has an apiary of 14 swarms of bees of his own. They are kept by his uncle, M. M. Rice (the man who took you down to Mr. Dexter's, in his buggy, when you were here). If you remember, when you were at my place you climbed on top of a honey-barrel with your Kodak, and took a view of my apiary; and when you got down you went and pulled some grass away from a church bee-hive (as we call it), to also take that with your Kodak. I told you then it belonged to the boy. I wish he could see the picture of it, as you took it then. He often speaks about it, and asks me to ask you about it when I write.

B. E. RICE.

Boscobel, Wis., Sept. 30, 1889.

I remember quite well, friend R., taking a picture of the church hive with the Kodak. I had forgotten, however, that it belonged to the boy. We have the view of the hive; and as it belongs to one of the boy bee-keepers I think we shall have to have a pic-

ture made. Tell my young friend to be patient. It will probably make its appearance by and by. I shall always remember you all with a feeling of gratitude for making my short visit so pleasant—especially M. M. Rice, who so kindly placed his horses and buggy at my disposal, that I might make the most of the half-hour I had to stay.

WHAT MAKES THE BEES DIE?

This is the third September I have been here, and our bees begin dying about Sept. 10th, but from what cause I can't tell. I asked, a year ago, one of our best bee-men. He told me it was only the old bees dying; but I can't see it so, as I find about as many young bees as old ones. They act as if they were stung. Last September my bees were in good condition. There were some eight stories, full of bees. When cold weather came they could cover only four Langstroth frames. At this writing they are dying very fast. I find plenty of sealed and unsealed brood. They now work on steelweed and goldenrod, which yield honey well. Our steelweed is one of the best honey-plants I ever saw. It blooms from September 10th till frost kills it. It takes a hard freeze to kill it. Common frost makes it better for honey.

F. H. COWDEN.

Morristown, Tenn., Sept. 22, 1889.

From your description I should infer the trouble was caused by something the bees had got hold of. Is it not possible that Paris green or London purple has been used in some manner, and that you have let your bees get hold of it?

REPORTS ENCOURAGING.

FROM 5 TO 20, AND 1142 LBS. OF COMB HONEY, AND HIVES WELL SUPPLIED FOR WINTER.

I have a very good yield of honey to report. I started with 5 colonies of Italians last spring in Simplicity hives. They have increased to 20 colonies. I have taken off 1142 lbs. of surplus honey, mostly in 1-lb sections, and the hives are all full in the lower stories, with the exception of one.

Earlville, Ill., Oct. 1, 1889.

L. A. JUDD.

\$1115 AS THE GROSS PROCEEDS FROM THE BEES.

I guess you will have to put me in among the Reports Encouraging. My report for this year is as follows: Commenced with 119 swarms; increased to 158 (should have had more if I had not doubled up). I bought an apiary of 53 swarms, not far from mine, just as they stood, with surplus honey, for \$159. Honey was all sold from both yards, amounting to \$915. I have sold 50 swarms without the surplus honey, for \$200.

C. A. SAYRE.

Sargent, Ia., Oct. 16, 1889.

A PREMIUM ON EVERY THING.

We got the premium on all the articles we took to the fair—8 in all—comb honey, extracted honey, best display of honey, honey pickles, honey cake, honey vinegar, Japanese buckwheat, and a fat girl baby. How is that?

REPORT.

My honey crop this season was 1800 lbs. comb in 4¼ sections, and 700 lbs. extracted. It was about all gathered from the 15th of August to the 15th of September, and is of a fine quality, and is selling at

12½ to 15 cts. for comb, and 8 to 9 for extracted. Bees are in good condition for winter.

Harris Station, Ind., Oct. 11, 1889.

J. KUNZ.

Now, look here, friend K., it seems to me that a man who has so many premiums, and a fat girl baby besides (that took the premium) ought to be able to tell how many colonies of bees he had when he got 1800 lbs. of comb honey and 700 of extracted. If you had only 10 colonies to begin with, it is a big thing; but if all that honey came from 200 colonies, it was not a very big thing, after all.

OUR QUESTION-BOX.

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 147. *What is the objection to the use of drone foundation in the sections? Bees always build drone comb if the sections are not filled with foundation.*

I see no objection.

MRS. L. HARRISON.

No objection. No, they don't.

A. B. MASON.

The honey from workers looks finer, and the expense is about the same. Thus I prefer worker. I have no use for drone foundation.

A. J. COOK.

We prefer worker comb, for, if the queen finds her way up to the sections, the workers produced will have a value, while drones are worthless.

DADANT & SON.

Drone comb in the sections induces the queen into the surplus apartment when the amount is limited in the brood-chamber. It does not look as well in section honey.

H. R. BOARDMAN.

Queens are much more apt to deposit eggs in it than in worker size. I am inclined to think that it is not usually built as firmly to the sides of the section, and is more easily broken by rough handling. Its general appearance, to me at least, is inferior.

O. O. POPPLETON.

Where a queen-excluding honey-board is not used, the queen is more liable to deposit eggs in sections containing drone comb than in those containing worker. After the sections are finished, those having drone comb in them do not look nearly so nice as do those with worker.

G. M. DOOLITTLE.

The objections can not be very great, except that the drone-cells are filled with eggs by the queen, which may be expected if drone-cells are scarce in the brood-chamber. Besides, bees seem to give some preference to worker-cells when honey is coming in. They are generally filled up first.

C. F. MUTH.

I don't know that there is any objection to the use of drone foundation in the sections; but bees do not always build drone comb in sections, if the sections are not filled with foundation. I have in my honey-house to-day as nice sections of all worker comb, as anybody would wish to see, built down from half-inch starters.

E. FRANCE.

I am not authority on comb-honey production; but my present convictions are that I should prefer worker foundation, even in the sections. I have

noticed that bees when given an equal chance will fill worker comb soonest. Should we use drone comb in sections, it would necessitate having two machines or sets of rollers by those who manufacture foundation.

S. I. FREEBORN.

The main objection is the inclination to raise drone brood—a great nuisance where no queen-excluding honey-boards are used. This is entirely obviated by using worker foundation. Another objection that I have is, that honey in drone comb does not look so nice as honey in worker comb, and is less readily sealed by the bees. The latter is especially noticeable when the crop is cut short.

GEO. GRIMM.

The principal objection to drone comb has been from the fact that the securing of all worker comb in the brood-nest by the use of foundation has led the queen to use the drone comb in the sections; but now that the queen can be kept from the sections by perforated metal, we should be more in favor of using drone comb. I have used drone comb with impunity wherever I desired to in my extracting supers, and kept the queen from them with the metal. Great is perforated metal!

RAMBLER.

I know of but one advantage of drone comb in sections, which is, that it takes less wax to contain a given amount of honey, and I think this is over-balanced by the more fragile character of such comb in handling and shipping. Yes, bees fill out vacant places in sections with drone, but not primarily to store honey in, but for the queen to lay in; and I have often seen drone-cells in sections well drawn out, and not a drop of honey in them, while the worker-cells were filled and perhaps sealed. If a queen ever gets up into a super to lay, you will pretty surely find her laying in drone-cells there, and drone foundation in sections might be an inducement for the queen to go up and lay in them. I don't think a section of drone comb looks as well as worker.

C. C. MILLER.

In the production of comb honey, properly managed, there is no use for the queen-excluding honey-board; but there would be, if you used drone foundation in the sections unless there were lots of drone comb in the brood-chamber. Again, if you did use a queen-excluding honey-board, every queen in the apiary that could manage to get through the metal perforations would get up above if there were drone comb in the sections. I believe the bees would urge her up there, they knowing that the drone comb was there and there was none below. It is the bees that are boss, not the queen. Most people think worker comb handsomer than drone comb. I do not, but the querist will remember that he is raising honey for most people and not for me. No, we have no use for comb foundation, nor drone comb either, except in stock hives.

JAMES HEDDON.

The statement with which this question closes is not true, by a long way. My honey is all built from very narrow starters; and about one-third of it, this year, is of worker-sized cells. I have just been looking over a box of unfinished sections put by for next season's use. There were 21 with worker comb, while those with drone comb, counting in with them those that had the two sizes, about half and half, numbered only 26. I can not give any objection drawn from actual practice. A theoretical objection is, that bees seldom incline to build drone

comb much, unless honey is coming in with tolerable rapidity. Some of us have to have our crop gathered while honey is coming in slowly; and if the super were chock full of drone foundation, bees might feel disinclined to go on with it.

E. E. HASTY.

There seems to be a pretty fair agreement in regard to the matter, friends. I believe that Dr. Miller, however, is the first one who suggests that drone comb would be a saving of wax, and suggests one thing that I never thought of before; that is, that honey stored in drone comb is less substantial. It seems a little queer that the queen should go up in the sections because they contained drone comb, when she had never been there at all. Perhaps friend Heddon has the correct explanation in regard to it. I expected, when I first saw the question, that a good many would object to the concluding remark. I presume the writer of the query meant that bees will always build *more or less* drone comb if a foundation of worker comb is not furnished them.

MYSELF AND MY NEIGHBORS.

After this I beheld, and, lo, a great multitude, which no man could number, of all nations, and kindreds, and people, and tongues, stood before the throne, and before the Lamb, clothed with white robes, and palms in their hands.—REV. 7: 9.

A SUNDAY IN CHICAGO.

THE convention mentioned elsewhere adjourned at one o'clock Saturday afternoon. Now, Chicago is a wonderful city. A single street in it, I am told, is 35 miles long, and there is ever and ever so much to be seen in the great city; notwithstanding, when the convention was over I wanted to go home a good deal more than I wanted to see any thing else on the face of the earth. I knew that a train would leave in the evening that would land me within perhaps 20 miles of my home, at about one o'clock Sunday morning; and I even began arguing with myself that it would not be wicked to travel on Sunday before daylight. I did not propose to walk the whole 20 miles; but I figured up that I could telegraph to Ernest to meet me about breakfast time, part way, and I could walk eight miles before breakfast, as I did once before. Ernest would have to get up a little earlier than usual Sunday morning, but we could both be home and still have plenty of time for church. Now, this is just what I longed to do, and found it hard to refrain from doing. But something else said, "No, my child, you have really no right to indulge in such a piece of eccentricity. You have much reason to thank God for the strength he has given you, and for the energy with which you meet difficult tasks when they come. But this is not one of them. Remember the Sabbath day, to keep it holy. By far the better way for you will be to stay in this great city, and inquire, as you have done hundreds of times before, 'Lord, what wilt thou have me to do here *this* beautiful afternoon?'"

I obeyed the voice, but I confess that I did not find much enjoyment in it. I visited a nephew of mine in the suburbs, and together we visited the celebrated town of Pullman, where the palace sleeping-cars are made. The place is something wonderful, surely, but I have not time to describe it now. Saturday evening we attended a meeting of the Y. M. C. A., in Farwell Hall. I was much interested, but no particular blessing came to me there. I had simply the consciousness of doing my duty, but at the same time I was just a little bit homesick. The garden down by the creek, my little spring, the carp-pond, and the vegetables that stand the cold weather, including the strawberries, had more attractions for me than any thing that great city could furnish. I felt glad that God had given me a faculty to enjoy innocent, inexpensive amusements; and I felt glad that I loved the home, and the loved ones God has given me, better than any other home, or the home of anybody else, if you choose.

As usual I was up Sunday morning as soon as there was a glimpse of daylight. The great hotel looked about the same Sunday morning as at other times. In fact, there is hardly any morning, noon, or night, for the electric lights keep it about as light at night as by day, and there are always quite a good many folks around. Even early Sunday morning there are quite a few early risers—newsboys and others, moving about. May be you feel like inquiring whether I succeeded in finding a Bible at the Commercial House in Chicago. I was provided, however, so I did not need to inquire. There is one thing I did like very much. A large plain bulletin-board near the entrance of the hotel told all about the religious meetings, Sunday-schools, prayer-meetings, etc. This bulletin-board is corrected quarterly by the different pastors. From that, and from the daily papers, I learned there were no services of any kind until half-past nine. Long before that time, however, I had read my Bible until I was tired, and felt as if I *must* stir around outdoors. Now, I do not believe the all-wise Father expects me to stay indoors until I get dull and sleepy, even if it is Sunday. In a great city one can not get out at all unless he goes out on the streets. I decided to take a walk and look at the different church buildings, whose spires rose from every quarter of the compass. Many of them had very pretty bulletin-boards near the entrances, giving the hour of service, and extending a cordial invitation to strangers. Pretty soon my eye caught a glimpse of a little girl hurrying along with a book in one hand. Soon another one hurried in the same direction. It reminded me of the time when I was writing the chapter on "bee-hunting," in the A B C book. For weeks and months I roamed the forest at different times, eagerly following every bee I could see on the wing, and scanning trees having any appearance of hollows or openings where the bees might enter. When we saw a bee alight near one of these openings, and creep in, what a shout we set up! Now, I did not set up a shout when I saw these

little girls enter the basement of one of the great churches, but I felt just like it. As I neared the door a couple of boys came along, and they too had books. I asked them if it were Sunday-school where they were going, to which they replied in the affirmative.

"May I go too?"

They stopped, took a better look at me, and replied with smiling faces, "Oh, yes! We should be very glad to have you come with us."

As the door opened, a burst of music from childish voices came out and greeted my ear; and then something seemed to say to me, "Look here, brother Root. You have been saying to yourself that you have not had any thing like a blessing for having decided to remember the Sabbath day to keep it holy. What do you think of that strain of music?"

I did not say any thing out loud, but I said inwardly, "Why, it is just glorious. May the Lord be praised for the discovery I have made of such a Sunday-school, and so early in the morning!"

I think we were a little late, for they were all singing from their books. One of the boys showed me a seat, and another one looked from his book enough to see that I was a stranger, and instantly extended his book to me, with his finger on the place; but before my eyes caught a glimpse of the strange characters on the printed page my ears had told me that the singing was in an unknown tongue. From five hundred to a thousand bright, sweet-looking boys and girls of different ages were gathered in the great basement of that enormous church; and although I could not understand a word of the hymn they were singing, I knew it was praise to God, for the music was one of our most familiar hymns. Of course, I thanked the little friend who brought me the book, but I was obliged to explain to him that I could not read it. He looked up at me with curiosity and surprise, and said, in good English, "Why, can't you read German?" I shook my head, and so he kept his book. Very soon another childish face caught my pleased glance, and he too brought me a book. Then a third one did the same thing, until I began to decide that I should have to take a book and look on, or all the children near me would feel they were lacking in courtesy. My friend, is it a lesson to you as it was to me? Are the children in your Sunday-school, every one of them, taught to hand their book to a stranger as soon as they notice his presence? If not, then I want to tell you that we are, a good many of us, behind. As hymn after hymn was sung (all of them were very familiar tunes), I began to get happier. The children, almost without exception, entered into the spirit of the singing, with a heart and soul I never saw before. It seems to me that the sight of their faces alone, even if I had been totally deaf, would have filled me with thrills of joy. I looked from the pupils to their teachers. Many of the teachers were in their teens; but I tell you they were faithful and honest teachers. The boys in the class near me were restless, and full of pranks, as they are in almost any

other Sunday-school, and they made quite a good deal of noise when they were not singing. The youthful teacher remonstrated in German, several times; but it did seem to me as if some good forcible English was what was needed. I was a little startled when he evidently came to the same conclusion, for he spoke out in the clear tones of my mother tongue, "Look here! can't you behave yourselves just a minute or two until school is out?" Some of them looked at me and smiled, thinking that, perhaps, as it was something I could understand, they would have (out of respect to me) to do a little better, and they did.

It was not only the children I loved, but the great tall heavy superintendent. I have often seen German people gesticulate, and, with motions of the body, make clear their meaning; but it has usually been in the neighborhood of a beer-saloon. It never occurred to me before that this same talent for gesticulation could be used in explaining the Scriptures and in glorifying Christ Jesus. I could catch, from the faces of the audience, especially the teachers', the points he made in his remarks and motions; and when they came to repeat the Lord's prayer in concert I was pleased to know that I could keep track pretty fairly. Before the school closed I also caught glimpses here and there of what was being said and talked about. How that big superintendent *did* get around among his teachers and hundreds of pupils! I have seen people take long strides before, but I believe that this man did more work in a few minutes in the line of superintending the Sunday-school than any one I ever before met. Before the school came to its close I made up my mind I would never doubt again, when tempted to run away from the path of duty. Why, I actually began to think that I should find no enjoyment and no blessing at all to compensate me for having resisted the impulse to run home. The thought of that Sunday-school will brighten my whole life; and it is particularly along in the line of our text that I feel such a thrill of pleasure when I think of it. It seems to me that I there beheld the great multitude of which John spoke—a multitude which no man could number; a multitude composed of those who spoke another tongue, and people of another nation. They stood before the throne of God, and they were surely clothed with white robes compared with many of the children of our great cities whom we meet on the streets. I did not understand the language, but I have not a doubt but that it was something akin to "Salvation to our God, which sitteth upon the throne, and unto the Lamb." I love that school because they gathered there so early in the morning; and it gave me a feeling, too, that the other great churches in Chicago were not built entirely for show and effect; that even the basements were being used to glorify the Lamb of God which taketh away the sin of the world.

I have before spoken of the faithfulness and honest sincerity that I have found among many of the German people who come from the "fatherland" to our shores.

My heart has often been touched to see how patiently, and with what fidelity they will stick to their task until it is done *well* and *thoroughly*, and oftentimes in striking contrast to the heedless and slack way in which we Yankees "hustle" things. I had a strong love for the German people before; but as the glimpse of that Sunday-school comes again and again to my memory, and as the snatches of melody from the hymns I heard there sung by many voices come again and again to my ear through memory, I feel a stronger love and a greater desire to grasp these friends from another shore by the hand, and bid them welcome. I like to get hold of the hands of the mothers and of the little children; I like to grasp the stout heavy hands of the fathers—hands that have been made tough and hard by years of toil; and I like to say, "Welcome, dear friends, to these broad lands of ours, offering so many opportunities and privileges to those who love to work." Yes, I love the German people, and I love Chicago too, in a way that I never did before, since staying there through the Sabbath, in obedience, as I believe, to God's holy command. Not only had I found many *neighbors* in Chicago who spoke my own language, but I found neighbors among those who spoke a language I did not understand at all; yes, and neighbors who worshiped God in that to me unknown tongue. I shall be less afraid, I think, should God ever call me to stay there again; for is it not true that all nations and kindreds and tongues and peoples *shall* stand before the throne, clothed in white robes, . . . saying, "Salvation to our God, and unto the Lamb?"

THE NORTHWESTERN BEE-KEEPERS' CONVENTION AT CHICAGO.

AN ABBREVIATED REPORT, MOSTLY FROM MEMORY.

IT was my good fortune to be present at the deliberations of the bee-men of the West, on Friday and Saturday, October 11 and 12. Having it come so near the last of the week was, on many accounts, objectionable, but the reasons for doing so were that we might take advantage of the reduced rates offered, especially to those who wished to attend the Chicago exposition. Although reduced rates were announced in the papers, none of the railroad officials this side of Chicago seemed to know any thing about it. I presume it was a mistake, or an omission somewhere; but I think that such mistakes are unfortunate, especially for the railroads, as it encourages people to make unkind remarks in regard to railroads in general—that "they make these offers just to get our money, without any expectation of giving reduced rates at all," and such like expressions. I do not believe this is true; but I think it more likely that it was through somebody's neglect. There is a good deal of machinery connected with our great railroads; and although the work they have accomplished is stupendous, we must still keep in mind that the individual members of these great companies are all human. Some of them are dishonest and

tricky, it is true; but by far the larger part are only guilty of forgetfulness, procrastination, and neglect, just as you and I are.

The first familiar face I met was our old friend J. A. Green, whose writings have made his name a familiar one. Shortly afterward I met friend Heddon and his son, a nice young man perhaps some younger than Ernest. The president, our good friend Dr. C. C. Miller, came a little later, accompanied by his sister and sister-in-law. Mr. Aspinwall, of potato-planter celebrity, was there with his combs made of wood. He is getting to be quite enthusiastic in bee culture, and it was quite a pleasure to hear him talk.

How early shall we put bees in the cellar? was decided by a vote—the greatest number favoring about Nov. 25. I was a little surprised at this, because I supposed experience of late was in favor of almost one month earlier; and most of the friends present came from a much colder locality than our own.

In regard to the best size of section, the general preference was in favor of the one-pound, or, perhaps a little better still, something a little *less* than a pound. The objection to having them run over a pound was, that consumers usually inquire first the price of honey. If the reply is, "Sixteen cents," and a section is handed out, if it weighs up only 15 or 14 cents, it is all satisfactory. If, however, the dealer explains that, although it is a pound section, it weighs more, and the price is 17 or 18 cents, many feel a little as if there were some kink about it that was not quite straight. Very likely this is true. But our Simplicity section, as a rule, especially where separators are used, runs a little less than a pound, rather than over. Friend Heddon remarked that he sold half-pound sections readily for 10 cents apiece. With us, however, half-pound sections have not been a success. Our customers have become used to a pound, and they do not take readily to something different. Perhaps one reason is, that we have pasteboard boxes made expressly for the one-pound section, and we have not as yet had any made for the half-pound. In regard to supers for comb honey, something like the T super seems to receive the preference. When one has more bees than he wishes, uniting in the *spring*, so as to make colonies extra strong, is recommended. To facilitate the disposing of extra queens, I would suggest timely advertising.

PREVENTION OF SWARMING.

With out-apiaries it is especially desirable to have as little swarming as possible. Our enthusiastic friend Aspinwall thinks he can prevent swarming by the use of his wooden combs. If the bees have no drone comb, and no opportunity of making any, they can not rear drones; and friend Aspinwall says no colony swarms until it has drones or drone brood. I do not remember that this matter has ever come up before in just this way. It has set bee-keepers to thinking, and the matter will be tested pretty thoroughly, doubtless, during the coming season.

UNFINISHED SECTIONS.

The old question that was discussed two years ago was revived. J. A. Green still insists that it does not pay to keep over old sections partly filled with comb; that is, no more than what are needed for bait combs, say one or two in each super, to get the bees to commence readily above. Others insisted that they could get quite a yield of honey by having sections partly or nearly filled with natural comb, where they would get little or none with empty sections, or even with sections having full sheets of foundation. Dr. Miller piles his supers of unfinished sections up, then places them in a hive, in the open air, and contracts the entrance of said hive so that only one bee can get out and in at a time. He says it does not encourage robbing, but, on the contrary, the bees clean out the sections so nicely that there is no more tendency for the honey to candy when placed in these old combs than if put in combs nearly drawn out from fresh foundation. Several recommended breaking down the comb in old sections, so the cells were, say, not over a quarter of an inch deep.

QUEEN-EXCLUDING ZINC.

Quite a discussion was also given in regard to this. I believe the general tendency was, however, greatly in favor of using queen-excluding honey-boards. Some of the zinc used in our early experiments was too large, and some was too small. Very likely there is not a perfect agreement among bee-keepers as to the proper size of perforations. Three different sizes are, I believe, now on the market, varying but a hair's breadth, however.

I was pleased to find one of our commission men, Mr. R. A. Burnett, present at one of the sessions, and he talked to us on

MARKETING HONEY.

He says that honey, as a rule, ships much safer in October and November. When the weather is very warm, there is much greater danger of breaking and leakage. He says the pound section seems to have pretty much driven out all other sizes. For extracted honey, the 60-pound tin can boxed seems to be the best package, and I believe it is also recommended as being the best for storage.

BROAD AND NARROW TOP-BARS TO FRAMES.

There seemed to be a difference of opinion in this matter. While some prefer top-bars $1\frac{1}{2}$ inches wide, by far the greater number seemed to prefer them about $\frac{3}{4}$. Very likely the wide top-bars might work something as does a honey-board in discouraging brace-combs between sections and the top of the frames, or between the sections and the honey-boards.

OVERSTOCKING.

While without doubt many localities are often overstocked, the general opinion seems to be that we may keep from 75 up to 150 colonies in a single location, rather than to start an out-apiary. Circumstances may, however, modify this a good deal.

For a more complete report of the convention, see the *American Bee Journal* for Oct. 23. In fact, I am indebted to the report there given for bringing to my mind the many points considered.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

RAISING THINGS UNDER GLASS.

I AM going to give you a talk now, dear friends, on a subject that has been on my mind for several years. In fact, I spend hours and hours in inventing and planning in regard to it. I have enjoyed myself, too, in the work, even though it has not as yet amounted, probably, to very much. Sometimes when I am taking a buggy-ride in the night, or riding on the cars, I say to myself, "Now for a good time inventing, planning, exploring, etc." In the first place, I have never been satisfied in raising lettuce, radishes, strawberries, spinach, corn salad, onions, cucumber, etc., under glass. The reason I have never been satisfied is, that they do not grow and succeed as they do outdoors. In fact, I have never seen many greenhouses in my life where things look as thrifty and healthy as I wish to see them look. Perhaps you think I demand a good deal. Well, may be I do. I should give up discouraged, perhaps, were it not that I have now and then had glimpses that seemed to show the possibilities in the line I am looking into.

Another thing I do not like about plants under glass: it is the almost invariable green-fly accompaniment. Instead of getting the conditions just right for the growth of lettuce, tomato-plants, etc., we seem to almost invariably hit upon the exact conditions required for raising the green-fly. If that were what we set out to do, we might rejoice over our complete success. First you know, here and there will be the little white specks on the ground, indicating their presence. Examination shows just occasionally a green fly. In a week there are hundreds, and in two weeks may be a hundred thousand. If you enjoy seeing growth and multiplication in animated nature, you have it with the green fly, to a dot. Well, why does the green fly grow indoors and not out? I have never yet found anybody who can tell; but I think I have solved the problem myself. Some years ago I speculated a good deal as to why there was not a green fly to be found in the open air, while they were a perfect pest in a bed not one yard distant, under glass.* Perhaps you may ask, "Why not have all the lettuce in the open

* I am aware that we can manage the green fly by the use of tobacco. Last winter one of our boys fumigated the greenhouse so thoroughly that he killed every fly in every stage of existence; but he killed all the tomatoes, radishes, and even injured the lettuce. But I do not like tobacco. I do not want it around our boys, and I do not want to regale the senses of our visitors by something so strikingly like tobacco juice squirted on a hot stove in a poorly ventilated room. Of course, if there is no other way we shall have to use tobacco dust, and tobacco smoke and vapor. But I believe there is a better and cheaper way.

air?" Why, we do do just that until the frost is severe and must have protection. Why not, then, cover it when the frost is severe, and no other time? Well, it is just the thing we are coming to presently but not just yet. The question now is, "Why does not the green fly flourish in the open air?" Well, I think I have solved that problem. At one time, when a bed was badly infested, some time in March, I think, the weather became warm enough so we could strip off the sash, and in a little while the green fly had disappeared, and the lettuce looked strong and healthy. Was it the circulation of air all around the plants, that they did not have under glass? I thought so once, but I afterward gave it up. A long drenching rain was what wound them up; and I feel sure, my friends, that it is the long drenching rains that stop the enormous multiplication of all aphide families. Perhaps you suggest a remedy—watering the plants profusely in the greenhouse. Well, I think this would answer, providing you could imitate a gentle shower, and keep it up for three or four hours. Spattering water upon the ground so as to make the ground muddy may perhaps injure the fly, but it also injures the plants. We have just experimented upon a pretty large scale with greenhouses made so the rain could come through all around the lights of glass; but it came in streams and "lumps," if I may use the expression. It made the ground muddy and soggy, and spattered soil all over the plants, and would not answer at all. So it is with a great part of the watering. Nothing has ever been invented so good as nature; and I propose that nature shall have her own way. Not only is rain better than any other kind of water, but straight sunshine without any glass intervening is better than any kind of sunshine that comes through glass, cloth, or any thing else. Newly transplanted plants, that need shading, of course do not come under this rule. In that case we wish to cut off the rays of the sun, and confine the dampness so that the ground shall neither bake nor dry, and so the plants may not wilt.

Now, then, we know what we want, or at least I think I know what I want. I want my whole garden right in the open air, where it can get the first ray of sunlight, without obstruction from trees or buildings, and where it can get the last ray at night in the same way. I want every thing in the open air the way I have described, until the nights get so cool that the plants will receive injury. Lettuce, strawberries, onions, spinach, radishes, and a large class of plants, do not seem to be hurt by nights so cold that the ground freezes so as to make a crust. They will, however, make more rapid growth if protected so that the ground does not freeze at all. If, however, all the crop is ready for the market, and we wish to hold it there in order that it may not shoot up to seed, then leave it out, even though the ground does freeze. Give it protection only when the foliage is liable to be injured. I have ascertained by experiment pretty nearly where this point lies. Even tomato-plants, when hardened by gradual exposure,

can be made so tough that they will stand a pretty cold snap. In fact, they do not seem to be very much harmed by a little snowstorm, providing the air is above the freezing-point at the time the snow falls. Cold winds do more damage, even though the temperature of the air is considerably above freezing, than does a light fall of snow without wind; therefore we want to make it a study to know just how much hardening our plants will bear and not sustain positive injury. At the present writing, Oct. 16, our peppers in the open air across the street from where I am writing have sustained no serious injury. Tomato-vines have been killed on the low grounds, and these peppers are scorched a *little*. But under the influence of our Indian summer they have made new growth, and we are having peppers in abundance. They have become gradually hardened, so they would stand a good while, if we could interpose glass or cloth for a few hours during severe weather. There is almost always quite a demand for all these things just after frost has killed them all. Many of our customers complain bitterly almost every year because they were a little too late in getting something they intended to get. Well, how shall we interpose this cloth or glass when it is wanted, and get rid of it quickly and easily as soon as it is wanted no longer? Another thing, I want to have the establishment look tidy. Sunshiny mornings, after the frost has melted away, the sash, cloth frames, sheets, baskets, boxes, newspapers, etc., scattered all about the garden are a nuisance. Besides, the wind gets hold of them, and blows them around in an unsightly way, to say nothing of the damage they do. I know how market-gardeners manage it. I have carefully hunted up all such establishments in the vicinity of many of our great cities. The only plan I have discovered is by means of the usual hot-bed sash. The bed is a little less than 6 feet wide. The sash are mostly more than 6 feet long, therefore a man is needed at each end of the sash to remove or put it back. It is true, a good strong man can handle sash alone to a certain extent; but it is very hard work. When the sash are removed, of course they must be put somewhere; and the customary way is to have beds of such length that the sash may be put in piles at certain intervals. These piles should not rise more than five or six feet, for convenience. Probably not more than 50 sash would be put in a pile; therefore if the sash are three feet wide, the piles would be 150 feet apart; and the men who handle them are obliged to carry the last sash removed, a distance of 75 feet to reach the piles. This makes it so big a job to cover and uncover the plants that the sash are on a good deal of the time when it would be much better to *have them off*; and, vice versa, they are off a good many times when they really should be *on*. My experience with handling sash has been that the plants are either getting scorched by frost or scorched by heat a great part of the time.

A year ago I procured three sets of Hitchings' apparatus for raising and lowering sash. These operate so easily that I oft-

en open them when the sun comes out from between the clouds, and close them again when it goes back under the clouds, and I really enjoy it, for the whole operation consists simply in turning a crank. I do not enjoy lifting sash at all, especially on a windy day; but I think that turning a crank is just fun, especially when I can see a dozen sash move in obedience to my will, and when I can hold them at any point without a bit of danger of the wind taking them from my grasp and doing damage. It takes an expert to handle sash without "putting his foot in it" every now and then; but any cheap boy can turn a crank. Now, I am not a "crank" myself, and have no ambition to be called one; but I do *love* cranks—that is, the kind I have described. I think you now see what I want. I want an arrangement whereby we can get either glass sash or cloth frames entirely out of our way by simply turning a crank, and can also put them back exactly in place, and have them held there safely by turning the crank the other way. If you want great power, the crank may be a very long one. In my recent visits to large cities I have been greatly interested in seeing two men, with a crank for each, *ten or twelve feet long*, move a great iron bridge, large enough to permit great vessels to pass through, and strong enough to hold heavy railway trains, after the bridge was back again in place. Yes, I have had *visions* for more than a year, of a great glass structure to revolve on a central pivot, just like these immense bridges. Half of this structure would be glass, and the other half an opening. One or two men could turn it around so as to present the glass toward the sun as it marched through the heavens; and when the weather is warm enough, the *open* space could be turned toward the sun, so as to get the direct rays; and when it rains, the whole contents of the greenhouse could have the benefit of the shower. If a steam-boiler is used to heat the house, a little engine would do the turning. In fact, a thermometer could be made by electricity to revolve the whole apparatus in obedience to changes of temperature. But I think I should prefer bossing the turning myself.* I have also thought of a greenhouse set on wheels, to run on a railway track. When the sun shines, push it back out of the way; when it gets frosty, shove it forward. As, however, it is risky business to move glass structures, we could, if we choose, have the *plant-beds* on wheels, and run them out for rain and sunshine, running them in again when they need protection.† The great objection to all

these arrangements is, that we must have twice as much ground as our garden occupies. In great cities, where market-gardening is mostly carried on, ground is quite expensive; and keeping an extra piece of ground, just for holding a glass house, or plant-beds, occasionally, is quite expensive. We want our glass sash or cloth frames taken away somewhere so as to occupy but little space.

What objection is there, do you ask, to Hitchings' apparatus for tipping the sash up edgewise? Well, in the first place this machinery does not tip the sash up so as to let the rain strike every part of the plant-beds. Perhaps it might be arranged to do this. Another thing, it takes enormous power to raise all the sash in a large greenhouse up on one edge. Do you say, "Balance them by a shaft through the middle, so as to swing them on their centers"? Very good, but still two difficulties present themselves. If we have the glass near the plants (and it is by far the better way), the sash will come down unpleasantly in the way when the weather is warm enough to have every thing open. Another thing: A sash, to swing on its middle, must have a great many openings in the greenhouse—openings of such a character that it is quite difficult to have them closed up tight when zero weather comes.

Perhaps I should explain, that, in our locality, there is not a month in the year, and very few *weeks*, when we do not have rain more or less, even in the coldest part of the winter; and when it is warm enough to rain, it is warm enough to have every thing in the open air. I have tested the matter on a small scale, far enough to know that excellent results can be obtained by such a contrivance as I have suggested. In fact, Peter Henderson has figured a house for hardy plants in the florists' line, made a good deal on the plan I suggest. You will find it in the *American Florist* for Aug. 1, 1889. You can easily test the thing on a small scale by making a plant-bed on the south side of some building. If a wing comes out just far enough to keep off west and northwest winds, it will be an advantage. Now have your sash hinged at the north side of your bed, so that it may be turned over against the wall of the building, and you have it. Even if your bed is 30 feet long, a man at each end and one in the middle would throw the sash over against the building, where it must be fastened, of course, to pre-

*This great circular glass house should have the lower edge of galvanized iron; and this lower edge, where it revolves, should dip in a trough of water. This would make it turn with great ease, and yet be perfectly air-tight. When the water in the trough freezes up, there would be no need of turning it; and the metal edge frozen fast in the trough of water would make about as tight a joint as one could ask for. If the circular house is not too large, the owner could swing it at any time by reaching one of the rafters overhead, and giving it a push. Of course, the expense of such a structure would be pretty heavy; and setting glass on a circular sloping roof is very expensive business.

†There is a pleasant feature about having the plant-beds on wheels. For economy of space they

could be pushed tight up against each other, occupying all the space usually used for paths or alleys, leaving room for only a single walk, on the south side of the house, for instance, so a walk can be made anywhere you wish by pushing the beds apart—that is, spreading them wherever you want to get in, instead of having the vacant space on the south side, as mentioned. This arrangement would also prevent dampness and mold, because the beds could be moved apart so as to let the sun and air all around them, underneath as well as overhead. The principal expense would be a level substantial track, with strong accurate wheels and axles, so the beds would move with very little pushing. I would adopt this plan were it not for the expense of the extra ground that can not, as I see, be made available for any other purpose; also the expense of the track, wheels, and axles. Possibly the plant-beds may be floated on water, like a canal boat, cheaper than to put them on a car.

vent the wind from blowing it down. Cloth frames answer excellently until we have heavy snows. I never want any thing to do with cloth frames when we have snow even half a foot deep. They may answer in October and November, and perhaps in March and April; but here we are liable to have snows that make trouble, both in November and March.*

Now, I have given the above as much with the idea of possibly receiving some hint or suggestion from some of my readers as with the hope that it may prove helpful to those who have been studying along in the same line with myself. I would suggest an easy method of having flowers and vegetables, that might need fall protection, and yet have the apparatus at all times present a neat and tidy appearance.

Let A represent a plant-bed; but instead of having it 6 feet wide, let us have it only 3. The dotted line represents the height of the soil. The sides may be made of boards held in place by sticks. These boards must be 18 inches if the bed is 3 feet wide. B B are cloth frames hinged at C. The hinge may be of leather, or even the edge of the cloth tacked to the board forming the side of the bed. Now, when it is frosty the frames B B are turned over so as to cover the bed, resting on a stake just above the letter A. When they want sunshine or rain, raise them up and let them drop down by the sides of the bed shown at D. The wind can not hurt them in this position; and if the bed is not very long, you can open or close the frames by standing at the head of the bed and taking one in each hand. Glass may be manipulated in the same way, only that it would be pretty heavy, requiring a man at each end, say for a bed 15 or 20 feet long. Another objection to this arrangement is, that the soil, being 12 or 15 inches above the surface of the ground, would freeze through quicker than if the path were not so far below it. Peter Henderson once said to me that he had got tired of hot-beds or cold-frames where one could not come inside to regulate the temperature, and I think a good deal the same way. I want to be inside, not only to see what is

going on, but I like to be where it is warm and comfortable; and if it is too hot or too cold, turn the aforesaid crank one way or the other.

I spoke of killing the green flies by a drenching rain. I have tested watering with a fine spray, such as the Nixon nozzle gives, and this seems to answer a good purpose. Very likely the dews of night have considerable to do with keeping down the aphide family. Now, if there is no dew in our greenhouses or cold-frames, we are not following nature. Another point comes in here: If we water the plants so profusely as a shower of several hours, there must be some provision not only for rapid drainage, but to have the soil dry out as it does in the open air we must have a *movement* of the air. Stirring the soil, together with a circulation of warm air, will dry out the ground as it dries outdoors. Now, when the weather is too cold to allow us to open the ventilators for many days, do not our plants suffer from a lack of air? And this suggests the thought that has often come to me—why not warm greenhouses as we often do dwellings and public buildings, by blowing through them a current of warm air? One of our factories is warmed and ventilated in this manner, and it is the most satisfactory warming we have ever had. A very gentle blast of air—perhaps just enough so that the warm air is slowly pushing out through all the crevices, will accomplish the result; and as this would prevent cold air from pushing in at the crevices, may it not be as cheap a method of heating as any? I have never succeeded in getting any satisfactory growth of plants unless very profuse watering was followed by the gradual drying-out of the soil until another profuse watering could be administered with safety. Watering, without giving the soil time to dry out, produces dampness and mold, which very soon destroys most plants. The great troubles that have come from the rotting of lettuce in greenhouses seems to me can be accounted for by a want of dry air to dry out the soil, as well as for want of sunshine. Running steam-pipes underneath the beds is a pretty good way of accomplishing the result. But steam-pipes will never dry any thing unless a circulation of air is also assured. We once built a dry-house, and were surprised to find the lumber would not dry, no matter how hot we made it. When we sent a stream of air over the steam-pipes to warm it, and then passed it through the lumber and out into the open air as fast as it became loaded with moisture, then our lumber dried out promptly. Do we not need something of the sort in our greenhouses, especially during the winter months when we have many cloudy days and little sunshine?

Since Peter Henderson's arrangement above alluded to comes the nearest to filling the bill of any thing we have as yet found, I have thought best to submit it on the next page, with an explanation in Peter Henderson's own words:

LOW GREENHOUSES, OR PITS.

There is nothing new in the plan; it is almost identical with what we and others have had in use for the past thirty years, except it be that, instead of lifting the sashes individually for ventilation

* There is one way by which cloth frames may be made to answer all winter. Have shutters to put over them when more than half a foot of snow comes or is expected to come. The air space between the cloth and the shutters is an additional help to keep out the frost. When the snow has ceased falling, and the sun comes out, or if the temperature is mild, even if the sun does not come out, throw up the shutters. This makes additional work, but it will give very good results for a cold-frame. It is not, however, as good as glass, and is considerably more trouble.

SECTIONAL VIEW OF LOW GREENHOUSES, OR PITS.

A. Sash, 6x4 ft. B. $1\frac{1}{4}$ -inch steam-pipe. C. Cemented bench, $4\frac{1}{2}$ ft. wide. D. Walk, 2 ft. wide and $6\frac{1}{2}$ ft. from ridge. E. Yellow pine gutter, 10x4 inches. F. Front wall, $3\frac{1}{2}$ ft. high. G. Ground-level.

with an iron bar for a lever, we now apply the ordinary hoisting apparatus, so that every alternate sash on the south side can be lifted to a height of nearly four feet. This was the great desideratum in our first erections of these low houses, whether of fixed roofs or portable sashes, that for the purposes for which such houses are best adapted—the growing of hardy and half-hardy stuff—sufficient ventilation could not be obtained. These low houses are formed of sashes 6 x 4; the glass is double thick, 10 x 14. All sashes on the north side are screwed down, also every alternate one on the south side, the others being used for ventilation. This abundant means of ventilation makes such houses adaptable for any purpose that cold-frames or sunken pits are generally used for, such as the growing of violets, pansies, daisies, bulbs of all kinds, or, in short, any plant whose nature rebels against a high temperature in a dormant state. For dormant hybrid roses, clematis, hydrangeas, and carnations, we find them particularly useful, and we never before have had such satisfactory results from that class of plants.

The space occupied by these houses on our place is 300 feet long by 90 feet wide. The length is crossed by two potting-sheds each 15 feet wide. As will be seen by the ground plan, the paths are sunk, the sides of which are held up by brick on edge laid in cement; the benches are all cemented, thus always presenting a clean, smooth surface on which to set plants. The posts supporting the yellow pine gutters are locust, so that houses so built, we believe, will stand for at least twenty-five years, with but a trifle for repairs. The heating is done by steam, by three of Lord & Burnham's No. 5 hot-water boilers with a steam-dome attachment. The two $1\frac{1}{4}$ -inch pipes in each house are attached to the gutter-plate, as shown in the plan, which is sufficient to keep out frost in coldest weather; if heated by hot-water it would require exactly the same amount of four-inch pipe to do the same work. It is in such conditions as we have here, however, where steam has the advantage over hot-water, the extreme point to be heated being nearly 600 feet from the boiler-pit: it would hardly be practicable to heat with hot water at such a distance.

This block of pits was erected by Lord & Burnham, and cost \$7.50 per running foot, for each house, complete. This, of course, far exceeds in cost that of the ordinary sunken pits, which we used for the same purposes, sometimes using them as sunken hotbeds, heating by manure; but two years' working of this new plant has convinced us that we would have been many thousand dollars in pocket had we made the erection years ago instead of bungling along with the cold sunken pits, because, not only is there always loss by breakage in matting up such pits, but often great loss to plants is sustained from snow-storms when the pits have to be kept closed. As a matter of fact, although the area covered by these low houses is considerably less than we had in sunken pits and cold frames, our output of plants has been more than doubled, and at much less expense in labor. Against that, of course, is the cost of fuel, which I

estimate to be only about \$500, as the temperature is at all times low, but, taken all together, it is perhaps the most satisfactory change in our greenhouse plant that we have ever made.

Although we use these houses only for half-hardy stock, and keep them at a low temperature, of course they can be used for other greenhouse stock by increasing the heat; but for growing flowers in winter, or for growing plants requiring a high temperature, such houses are not so well adapted as the modern rose-house, which I believe to be the best for any purpose of flowering or fruiting plants in winter. But most florists growing a general stock always find a necessity for cold-frames or retarding-pits, and for such purposes I doubt whether this style of low greenhouses can be much improved upon.

PETER HENDERSON.

Jersey City, N. J., July 11, 1889.

In addition to the above, the editor of the *American Florist* adds the following:

It should be added, that surplus water drains into the cemented walk; and the houses having a slight fall, the water flows easily in the side gutters to one end, where it is carried off by a sewer. The rafters and ridge-pole are of yellow pine. It will also be noted, as shown in sketch of interior, that each sash which is raised by the ventilating machinery is provided with two arms, one on each side. At the apex of the roof the two rafters and the ridge are solidly united by a small iron truss, which is undoubtedly of considerable value in strengthening the roof and keeping it in shape.

INTERIOR OF LOW GREENHOUSES, OR PITS.

For the use of market-gardeners we should not want the top of the beds cemented—that is, I would not; but this, of course, is optional. If I understand it, the sides of the paths are sloping, rendering them less liable to cave in. The bottom is also highest in the center, so that the workmen would not be obliged to stand in the water. Now, instead of having only every other sash on the south side hinged, I would have them all hinged. See cut on previous page.

Then I should want the sash-raising apparatus capable of throwing the south sash clear over, so as to lie on the north side of the neighboring house. If fastened there so the wind can not blow it over, it can remain all summer. The last row of buildings on the south side would need a fence, or some support for the sash. When thus arranged, the sun in the winter time would shine on every inch of ground inside of the houses; and if the rain were from the south, and driven sufficiently by the wind to fall at about the same angle as the sun's rays we should also have rain on every inch of the plants; however, this would probably not often happen; therefore a part of the interior would have to be sprinkled with the hose, in the usual way.

Now, then, the problem that confronts us is this: How shall we throw the sash, or, in fact, the whole south roof, over against the north roof, and bring it back? Pulling it over with a chain or rope will not answer, because it must be held at every point so the wind can not take it and smash the glass. The mechanism must raise it up quietly and let it down quietly. For the sake of economizing power as well as time, it should commence to rise very slowly and with a good deal of power. As it nears a perpendicular position the power may be decreased, and the speed correspondingly increased; and the same way in letting it down. The ordinary sash-raising apparatus does not move the sash through, say, one-fourth, or, better still, one-third of a complete circle. Perhaps, however, it may be arranged so as to do it. It can be readily arranged so as to move more rapidly and with less power when the sash comes near the perpendicular. I have figured a good deal on levers and endless chains, and sash balanced on centers; but time and again I am driven back to the ordinary sash-raising apparatus, modified so as to throw the sash clear over against the neighboring roof.

Now, friends, I have finished my long story, and you know just how far I have got in finding my ideal winter garden.

only. Now, brother bee-keepers, let every one, who possibly can, come to this convention, and let us get acquainted; and if it is a success, I am willing to take the honors; but if it is not, please do not mention it. It seems that somebody had to make the call, if we are to have a convention; and as no one else did, I now have done so. A place to meet at has been assured us, free of cost.
J. W. ROUSE.

GLEANINGS IN BEE CULTURE.

Published Semi-Monthly.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, OHIO.

TERMS: \$1.00 PER YEAR, POSTPAID.

For Clubbing Rates, See First Page of Reading Matter.

MEDINA, NOV. 1, 1889.

And they were all filled with the Holy Ghost, and began to speak with other tongues, as the Spirit gave them utterance.—
ACTS 2:4.

We have at this date 9144 subscribers.

NEW subscribers can have GLEANINGS from now till January 1, 1891, for \$1.00.

THE LONG ARTICLE, GARDENING UNDER GLASS, IN THIS ISSUE.

LEST some friend who does not care for gardening should complain at the amount of space I have occupied, I want to say that I told the printers I wanted four extra pages in this issue. They said they could not very well put in just four extra, but they could make it eight. Therefore, if you will notice you will see we have given eight extra pages this time—the five that do not cost you any thing, about gardening in the winter, and three more about bees, etc.

WHO CAN FURNISH QUEENS IN NOVEMBER?

We are just now in the same predicament we have been almost every year—lots of orders for queens, and none to be had. Will not some of our enterprising friends in the South put in an advertisement, to the effect that they can furnish untested queens to any one who wants them, as promptly as we are in the habit of sending them from here? We think it very much better for the seller and buyer to communicate direct during November and the winter months. Keep a standing advertisement all winter, of untested queens ready to ship by the first mail, and you will have a good business, even if you charge the prices given in our catalogue, for the winter months. We will make editorial mention, free of charge, in our next issue, of those who have queens on hand ready to ship.

POLYGLOT ORDERS.

We not only receive orders in English poorly written, poorly spelled, and as indefinite as any thing can possibly be, but we occasionally have orders from our friends across the water, couched in three different languages, particularly when the writer lives on the border line between two or three countries, such as Switzerland, where French, German, and Italian are pretty well mixed up. A postal card before us starts off in French, then copies some English from our price list, substituting German adjectives, and then winds up in French. A very convenient thing is to have a linguist who can read any of the three languages,

CONVENTION NOTICES.

The American International Bee-keepers' Association will meet in the Court-house, Brantford, Canada, Dec. 4, 5, 6, 1889. All bee-keepers are invited to attend. State and district bee-keepers' societies are invited to appoint delegates to the convention. Full particulars of the meeting will be given in due time. Any one desirous of becoming a member, and receiving the last annual report, bound, may do so by forwarding \$1.00 to the secretary.
R. F. HOLTERMANN, Sec'y.
Romney, Ont., Can.

TO THE BEE-KEEPERS OF MISSOURI.

After conferring with several bee-keepers, and at their request, I hereby make a call to the bee-keepers of Missouri to meet at Higginsville, Mo., on Thursday, Nov. 14, 1889, for the purpose of meeting in convention, in order to form an association; meeting to commence about 9 A.M., to last for one day

or a mixture of the three. No matter whether it is poorly written, or even written in three languages, or a mixture of the three, our proof-reader, some way or other, manages to decipher it. This is not written to encourage polyglot writing, but to show how the people of this world do write sometimes in conveying their wants. Now, do not get discouraged, friends. We are not finding fault, but the contrary. If writing postals in three languages is the best you can do, keep on and we will do the best we can for you. You remember the central thought of Our Neighbors this issue is about neighbors who speak to us in unknown tongues.

MOODY'S SERMONS.

ABOUT a year ago, or perhaps a little more, there was quite a disappointment because we were unable to get any more of the books entitled "Moody's Best Thoughts and Discourses." We wrote to the publishers, but could not induce them to get out another edition. One of the best things in regard to the book is, that whenever it got into a neighborhood it was loaned right and left until it got worn out. For ten years past I have kept a copy in our county jail, and almost every prisoner that gets in there was sure to read Moody. After the books were gone I tried to get even a single copy to put in the jail, but I failed. Imagine my astonishment when I found out, a few days ago, that our boys had a couple of copies of Moody's Sermons in their cheap library; but instead of being 75 cts. and postage, as is the book mentioned above, the price is only 30 cts.; by mail, 10 cts. additional. One of the books is entitled "Evenings with Moody and Sankey;" the other, "Hold the Fort." The latter contains quite an extensive biography of Moody and Sankey, as well as of P. P. Bliss, the author of many of the Moody and Sankey Gospel Hymns. The other is simply a collection of sermons. It also contains an account of the revival convention held in the city of New York, in March, 1876. Each of the books contains many of the best sermons heretofore found in the Best Thoughts and Discourses. As the books contain nearly 300 pages each, they are wonderfully reasonable. For some time I have lamented that there were not more good *moral* books in our cheap library. Both of these books are intensely interesting. If you just lay them around, almost everybody will read them; and I hardly need add, that nothing in the shape of a book has a more moral tendency, or a more elevating tone, than these reports of Moody's Sermons. I can not tell you how glad I felt when I found them for sale in our store, at the low price of 30 cts. each.

SEEDSMEN, AND A LITTLE PLEA FOR THEM.

I HAVE quite a good many times heard severe and uncharitable remarks in regard to seedsmen because of their enormous profits. Somebody, for instance, grows a crop of seeds for a seedsman. The seed is furnished him to plant, and he sells matured crops, say for from \$4.00 to \$5.00 a bushel. A few months later, when the catalogue comes out, the price may be perhaps \$15.00 or \$20.00. It looks bad, I confess; and I, too, used to indulge in severe criticisms. Since I have been dealing in expensive seeds, especially of novelties or untried things, I have had my eyes opened a little. At present our seed catalogue quotes the Ignotum seed at \$15.00 a pound, while we are paying only \$4.00 for the same amount. Why this great discrepancy? I will tell you. In our basement is quite a lot of seeds that have cost

me large sums of money. Some of them are old and worthless; others are not worth a quarter what I paid for them. I was foolish in buying more than the market demanded; yet we have been so greatly annoyed by being out of certain seeds when there came an unexpected demand for them that I have decided I would rather have considerable to throw away than to vex people by telling them we were sold out, or that we could not get any more without paying twice as much as we have been selling them for. No seedsman can tell how much he is going to need of any thing. Of course, he can tell something by past experience; but even with the best judgment he can bring to bear, he frequently gets badly "left." Now, I do not know how much Ignotum seed can be scraped up as the product of the seeds we gave away last spring; neither do I know how much is going to be called for. It is very desirable, however, that we have enough seed on hand to furnish some to every applicant. It is also exceedingly desirable for me not to have 25 lbs. (that cost me \$100) uncalled for. I have not yet sold a pound for \$15.00; but I have sold 6 lbs. for \$36.00, and 2 lbs. for \$20.00; and 8 lbs. is about all I have been able to buy so far. A good many seedsmen have asked me my best present figures. If any of you prefer to advertise what seed you have, rather than to sell it to me for the small sum of \$4.00 per lb., I am willing you should do so, for I have not told this little story to excuse myself, but simply to let you see how difficult a matter it is for a seedsman who expects to fulfill all his promises, and to supply all demands that come to him for seeds. Before spring the price of the Ignotum seed may be less than \$4.00. It may also be more than \$15.00. Supply and demand must decide. With alsike clover and Japanese buckwheat, of course the case is far different. What we buy for a dollar we can well afford to sell for \$1.25, because they are established staple seeds; but it must be remembered, that a bag substantial enough to stand shipping by freight must be furnished for each bushel, half-bushel, or even peck, and there is also some danger of having several hundred bushels of buckwheat on our hands, that cost us over \$1.00 per bushel, that *might* have to be sold for even less than a dollar. Seedsmen quite frequently sell even staple seeds at less than cost; therefore they can not bring the purchase price and selling price so near each other as one might, in taking a cursory view of the matter, think they should.

PURE WATER IN GREAT ABUNDANCE.

PERHAPS 20 rods from where I am writing this there is a rise of ground, and it goes up a little higher than any other ground in the corporation, or, in fact, in the vicinity of Medina. When I was a boy in my teens I often used to look at it longingly, thinking what a grand place it would be for a windmill. Windmills were my hobby then. But I did not suppose that it would ever be my good fortune to possess the ground, or perhaps to have money enough to build such a mill as I had in my mind's eye. So I contented myself with making a home-made windmill to do the churning for mother. That was thirty years ago, when windmills for pumping were almost unknown. They now dot the landscape everywhere; and within the past few months Providence has seen fit to permit me to make a purchase of that hill I have had my eyes on for over thirty years. Three days ago, as we

looked from the windows of the office, we could see, sharply outlined against the sky, the derrick, engine, walking-beam, and other machinery for drilling an artesian well. The drillers had been working for more than a week, exploring for pure water from the depths of the rock. We expected to be obliged to go down at least 150 or possibly 200 feet, on account of the elevation. Imagine the pleasant surprise, however, to find a vein of water at a depth of 97 feet and 5 inches that gave a flow of water equal to at least 500 barrels per day, and *may be* a thousand. We are now planning for the erection of a 2000-barrel tank, to be placed over the well and a windmill capable of raising 1000 barrels per day to spread its wings over it. Even if this reservoir stands on the ground, the elevation is sufficient to throw water on the roof of every building on our grounds; and last, but not least, to furnish, we hope, 1000 barrels of water per day for irrigating the strawberries and garden-stuff. We are just now rejoicing over this, another of God's gracious gifts. Well, the drillers have folded their tents, and the engine is to-day, Oct. 31, smiting the rock down on the creek-bottom ground, to see if it is not possible that some other gift was stored away, ages ago, through God's loving kindness for his children of this 19th century; and it reminds me again and again of the promise, "But the water that I shall give him shall be unto him a well of water springing up into everlasting life." We are planning to have all our buildings fitted with automatic sprinklers over all our ceilings, so that, if a fire should break out at any time of day or night, when nobody is around, the faithful little piece of mechanism will commence to drench the flames with water until one of two things happens—till the fire goes out, and somebody comes and stops the running water, or till that 2000 barrel tank gets empty.

THE OREGON STRAWBERRY, AGAIN.

OUR young friend Seth Winquist has just mailed us a plant, or clump of plants, in full bearing; and he packed them so nicely in moss that it reached us in perfect order. A single plant contained blossoms, growing strawberries, and ripe fruit, the latter in a state of perfect preservation, except some bruises. This single plant contained perhaps forty or fifty berries, green and ripe. One thing is certain, the berry does wonderfully in Oregon. Whether or not it will do the same here, remains to be proved. Those he has sent us are growing, but the growth is so far rather feeble. This, however, is nothing strange for the month of October. We are testing them, both in the greenhouse and outdoors.

SPECIAL NOTICES.

SPIDER-PLANT SEED.

Please do not send us any more of the above seed until further orders.

STRAWBERRIES FOR GROWING UNDER GLASS.

The new Jessie seems to be one of the most promising varieties for this purpose. If ordered before the ground freezes, say any time during this present month, the price will be the same as in the summer-time—10 cts. for 10; 75 cts. per 100. If wanted by mail, add 5 cts. for 10, or 20 cts. per 100.

FOTTLER'S BRUNSWICK CABBAGE SEED.

Several have inquired whether the Jersey Wakefield were the only stock seed we were prepared to furnish. It is the only kind, with one exception, and that is Fottler's Brunswick. It was raised by

H. A. March, in just the same way he raises the Wakefield. The price will be just the same; namely, 20 cts. per ounce, or \$2 50 per pound. The usual postage is to be added, if wanted by mail.

LETTUCE-PLANTS FOR COLD-FRAMES, HOT-BEDS, AND GREENHOUSES.

We have beautiful plants now ready to take from the seed-bed, of Grand Rapids, Boston Market, or Landreth's Forcing. Price 20 cts. per 100, or \$1.50 per 1000. If wanted by mail, add 10 cts. per 100, or 50 cts. per 1000. The above three are the most suitable for growing under glass, of any we have tried. Landreth's Forcing is much like Boston Market, only the heads are smaller, and it makes heads a little sooner. Grand Rapids does not make a head at all, but is fit for use at every stage. When successfully grown, however, in good soil, the stalks frequently weigh a pound or even two pounds each. The latter is the leading winter lettuce now, I believe, of the world.

SEEDS AND PLANTS IN NOVEMBER.

I presume that seedsmen ordinarily have very few orders during the present month. GLEANINGS, however, has such a wide field that it is time to make garden, at least in some of the homes where it goes, every month of the year. During the past two or three days we have been having quite a lively trade in seeds, from friends in Florida and California; and we are filling an order to-day, Oct. 30, for 1000 cabbage-plants, to be sent south, that will stand in the open air safely all winter. This reminds us that, if anybody wants cabbage-plants during the winter-time, from friend March's stock seed, we shall be very glad indeed to furnish them at regular spring prices, by giving us a little notice beforehand.

WHITE-POPULAR ONE-PIECE SECTIONS.

We have just got in several thousand feet of white-poplar lumber, which is much whiter than the best basswood. We made some of it into one-piece sections, and they fold without breaking as well as basswood, for any thing we can see. We will mail a sample to any one on receipt of 4 cts. to pay postage. If we get all the lumber we want, we shall probably be able to furnish them for 50 cts. per 1000 more than basswood. For the present, however, the price will be \$1.00 extra on each 1000. If any of our readers in Ohio and adjoining States live in a region where white poplar abounds, we should be glad to hear from them. The encouraging thing about this is, that we get a better-looking section, and at the same time stop to some extent the consumption of basswood, one of our best honey-producers.

PRICE OF ONE-PIECE SECTIONS.

We have for two or three years past made a cut of 50c per 1000 on one-piece 1-lb. sections, along with other makers, till the price is \$3.50 per 1000. Several have written to know if we were going to reduce again this fall. We answer, No. The price is low enough. We have written to the principal manufacturers, and all agree that, for small lots, \$3.50 per 1000 is low enough. Bee-keepers have reason to be thankful that the price is as low as it is. Had we not gone to the expense of over \$1000 in bringing the patent suit to a successful issue, the price would be more likely \$4.00 to \$5.00 per 1000. Having gone to that expense in the interests of bee keepers at large, we should like to sell sections a *little* above cost to make up that expense. Of course, if other makers can furnish sections in small lots for less than \$3.50, they are welcome to do so; but we think it would be better to have a uniform price.

GLEANINGS FREE TO NEW SUBSCRIBERS FROM NOW TILL JANUARY.

Our annual premium list will be out with the next number—that is, Nov. 15. It will be at least 20 pages with a cover, and there will be many inducements for repaying a little effort on your part in soliciting your neighbor bee-keepers to subscribe. We do not believe in praising up our own publication, as many do, and say it is better than ever before; and, in fact, we don't need to. We have the kind words of many readers, telling us how you appreciate our efforts toward making GLEANINGS valuable. The more names you can send us, the better we can make it. As an extra inducement, you may offer the rest of this year

free to new subscribers. Remember it is only the numbers remaining after the subscription is taken that we give free, so it is to their interest to subscribe at once. When the premium list comes out with the next number, we will make further announcements; and we trust many of you in the meantime will secure a good number of names.

A BUSH LIMA BEAN AS LARGE AS THE POLE LIMAS, AND AS EARLY.

Mr. J. Atlee Burpee has been kind enough to send me a single plant, that in every respect seems to be like the Henderson or dwarf Sieva lima bean, only the pods are full size. He will offer the beans for sale next year in limited quantities, but as yet no price has been fixed on them. This bean, we are told, was from a sport from the regular pole lima beans, and is just like them, except it does not need a pole to run on.

ADVANCE IN THE PRICE OF HONEY-EXTRACTORS.

We have sold, in the past, over 10,000 of our Novice honey-extractors, and the complaints in regard to them have been very few indeed. Some few, however, have complained that they are too light, and others that the honey-gate is a little too small, so that real thick honey will not run through it as fast as it is extracted. Another source of complaint has been that the honey was thrown over the edges because the can was not quite deep enough. We have decided to remedy all these defects, but will not be ready to place any new machines on the market before March or April. We make this announcement at this time so that, when new lists are printed, the correct price may be put in. We have outlined the improvements to be made, as follows: The bore of the honey-gate at present is $1\frac{1}{2}$ inches. We expect to make it about $1\frac{1}{4}$ inches. We have heretofore made the extractors of IX tin, and of several pieces. We have ordered a special importation of IXX tin in large sheets, so as to make one entire can of one sheet. These sheets are large enough to make the cans two inches deeper than at present, to prevent the honey from being thrown over the edge. The bottoms of the large cans, 20 inches in diameter, will be IXXX tin. These extractors will be worth fully twice as much in point of wearing qualities as the old ones, and yet we shall advance the price only to what it was two or three years ago; namely, \$1.00 more than the present price. The revised price will be as follows: Numbers 1, 2, 3, 4, and 5, \$7.00 each. No. 6, \$7.50; and Nos. 7, 8, and 9, \$8.00. We will also furnish an upright gearing, which some prefer, for 50 cents additional. We shall then have, we think, the best extractor, for the money, in the market.

KIND WORDS FROM OUR CUSTOMERS.

The queen shipped in August was received in good order, and has been safely introduced twice. I have hatched some fine queens from her.

ARTHUR SHEPARDSON.

Freeport, Wash. Ter., Oct. 10, 1889.

The plants were received in good condition. I am surprised at the size of the asparagus-plants. I did not suppose they would be so large at that price.

K. A. CLARKE.

Groton, Conn., Sept. 23, 1889.

GOOD ADVERTISING.

Please tell the friends not to send me any more orders this fall, for I have as many booked as I can fill. I return seven orders to-day, which I could not fill. Does everybody take GLEANINGS?

Morgan, Ky., Sept. 24, 1889.

J. P. MOORE.

The 60-lb. square tin cans are received, and are very nice. I have been shipping honey to all parts of the U. S. Surely it pays to advertise in GLEANINGS.

E. J. BAXTER.

Nauvoo, Ill., Oct. 14, 1889.

The goods I ordered of you arrived safely and in good order. I am much obliged for your prompt attention. Although I live in the northern part of Michigan, I was extracting with the extractor the fourth night after ordering it.

GEO. HALL.

East Tawas, Mich., Aug. 4, 1889.

VALUE OF THE HONEY COLUMN AS AN ADVERTISING MEDIUM.

I received an offer from Plymouth, Ohio, for the rest of my comb honey, and all my extracted, in answer to your insertion of my advertisement of honey for sale, and I am more than ever convinced of the value of GLEANINGS, both to producers of and dealers in honey and supplies, and tender you my sincere thanks for the favor. W. R. HASLET.
St. Anthony, Ia., Oct. 7, 1889.

I write to inform you that the Barnes combined saw came all right, and in good time. The reason I have not written sooner is, I wanted to try it before I said any thing about it. I have worked in wood for the last 45 years, so that I think I am competent to judge about the work it will do. It does all you claim for it, and will fully answer all the purposes that I desire. Many thanks to you and the Barnes Brothers for the machine, which I think now I can't do without. THOS. CHAPMAN.
Rocheport, Mo., Oct. 14, 1889.

A KIND WORD FOR GLEANINGS, TOGETHER WITH A GOOD TESTIMONY FOR CHRIST JESUS.

Dear Friend:—May the Lord bless your good work in the Master's vineyard, is my prayer. I read GLEANINGS, and it does make my heart rejoice to see the good work go on. I read GLEANINGS with pleasure. So far as the smokers are concerned, I hold that, if the heart is clean, the mouth will be clean too; for out of it are the issues of life. I have not used tobacco in any form since my conversion. G. D. KUNKE.
Sprague, Wash. Ter., Sept. 25, 1889.

A PLEASED A B C SCHOLAR AND HIS SUCCESS.

Those nice honey-jars arrived all O. K., as they were packed very nicely indeed, and I am much pleased with them, as also the vise and match-safes. I took the premium again at our State Fair, and almost everybody expressed themselves as seeing the finest honey in the world, and those nice white sections of yours "took the cakes." "Oh what nice white honey!" or, "how nice and clean those sections look!" As they looked on, they found some very fine extracted honey in your glass jars; also the expressions I heard were numerous, and greatly to the credit of A. I. Root; for if it had not been for him and his A B C, I am pretty sure I should not now be so far advanced, for it was only a few years ago that I was a perfect "novice" in the business, and had not even seen a queen; but now I am pretty sure I can tell one, as I breed all my queens myself. Well, I think that, if we all try to put our honey up in good shape, and in nice and attractive packages, we shall all do well. For instance, here in my own town of Reno there is lots of honey brought into the market which sells for from 12 to 15 cts. per lb., and I command \$20 to \$25 per hundred pounds. Now, how is it? I will tell you. The former is brought in boxes, leaky, and partly filled, and the very looks of it is enough to condemn it, while that of mine is all clean, and packed in your nice 12-lb. shipping-boxes, and, as a gentleman said to me yesterday, "You deserve a great deal of credit for putting your honey up in such attractive packages." You know the ones I got of you with glass on both sides, so they would show three sections on each side. I have just received a premium from San Francisco, from the Mechanics' Fair, the finest and best in the State of California. I try hard to do my best, and I hope all others will do the same. E. A. MOORE.
Reno, Nev., Oct. 17, 1889.

LITHOGRAPH LABELS.

In 12 Colors, at \$2.00 per 1000.

The 12 colors are all on each label. They are oblong in shape, measuring $2\frac{1}{2} \times 2\frac{3}{4}$. They are about the nicest labels we ever saw for glass tumblers, pails, and small packages of honey. We will mail a sample, inclosed in our label catalogue, free on application, and will furnish them postpaid at the following prices: 5 cts. for 10; 35 cts. for 100; \$1.20 for 500; \$2.00 for 1000. A. I. ROOT, Medina, O.

RERUM COGNOSCERE CAUSAS,

TO know the Causes of Things, is the key to Success in any industry. If you wish to succeed in the Bee Business, you must read and become acquainted with the most Successful Methods of Bee-Management and Honey-Production.

LANGSTROTH'S WORK,

REVISED BY DADANT,

Contains the result of practical experience with Bees. It gives the Physiology of the Bee, with numerous Quotations from the latest Scientific Writers, the Description of the best Hives, Directions for the Proper Management and Handling of Bees; the most Practical Methods of Queen-Rearing, Swarming (Natural and Artificial), with controlling methods; instructions on Establishing Apiaries, Transferring, Shipping, Mailing, Feeding, Wintering; the best methods of producing Comb and Extracted Honey, the Handling and Harvesting of Honey, the Making of Comb Foundation, etc., etc.

The instructions for the Rendering of Bees-wax are alone worth the price of the Book, to many bee-keepers who waste a part of their wax in rendering it.

This book, "the most complete ever published," is shortly to be published in the French, Italian, and German Languages, by Practical European Apiarists. It is highly recommended by all publishers of Bee-Literature in the Old World as well as in the New.

Cloth Binding, 550 Pages, 199 Engravings, 19 Full-Page Plates. Gilt front and back. This book is an Ornament to any Library.

Price: By Express, \$1.85. By mail, prepaid, \$2.00. Special prices to Dealers who wish to advertise it in their circulars.

We also offer for Sale, 20,000 Lbs. of Honey, of our crop of 1889; 25 Tons of Comb Foundation, Smokers, Bee-Veils of Imported Material, etc. Send for Circular. Address

KIND WORDS FROM OUR CUSTOMERS.

THAT BEAUTIFUL TESTED QUEEN.

That beautiful select tested queen arrived all right on the 25th of last month. I am well pleased with her. I think I have been successful in introducing her.

THOS. A. HARRISON.

Burnet, Texas, Nov. 4, 1889.

I have been without a timepiece for some weeks, and feel so lost I am constrained to write you for another watch. The one for which I sent you four dollars was such a beauty that, as soon as received, it was vowed to a nice girl, so I want another, though a cheaper one, for myself.

Tuscaloosa, Ala.

J. A. GOREE.

I received the smoker a few days after I sent. When I opened the package I was surprised to see such a new style. I have seen different kinds of smokers, but none so fine as that. I showed it to several of my friends, and they said that they will get one next spring. I am well satisfied with the smoker. I would not have any other kind.

Rahway, N. J., Oct. 27, 1889. V. N. BAGLEY, JR.

A GRAND EXCURSION THROUGH THE WEST.

Please state that a grand excursion leaves York, Neb., Dec. 3, for Washington Ter., via Denver and Colorado Springs, Salt Lake, Sacramento, Cal., Salem and Portland, Oregon, to Seattle; thence back, probably by Spokane Falls and Cheyenne to the starting-point. Round trip for \$60.00. Reduced hotel fare, and best of privileges; our own car clear through. We should like to have Uncle Amos along. He might see some fine views to snap his Kodak at; and, indeed, we expect to have a good time. Any one wishing to go, please apply to me for any other information.

R. R. RYAN.

Bradshaw, Neb., Nov. 2, 1889.

HONEY COLUMN.

CITY MARKETS.

NEW YORK.—*Honey.*—There is a fair demand for comb and extracted honey. Western comb is arriving freely; and although our market is not overstocked, prices have to be shaded in order to make sales. Off grades and mixed comb honey is accumulating, and there is no demand for the same. Several lots we sent out were rejected on account of poor quality, and left on our hands. Such honey will have to be sold at whatever price it will bring. We quote: Fancy white, 1-lb. sections, 14@15; 2 lbs., 12@13; off grades, mixed, etc., 10@12; buckwheat, 1 lb., 10@11; 2 lbs., 9. Extracted, white clover and basswood, 7½; orange bloom, 8½; California, 7½; buckwheat, 6; Southern strained, 70@75c per gal.

HILDRETH BROS. & SEGELKEN,

Nov. 6. 23 and 30 West Broadway, N. Y.

CHICAGO.—*Honey.*—Honey is selling quite well at the following prices: 13@14 for choice to fancy white comb in 1-lb. sections, where cases and frames are equally desirable. White comb in 1-lb. sections, not choice, in some necessary way sells at about 12; 1½ to 2 lb. frames, white, 10@12. Fall honey, buckwheat, etc., 8@10. Extracted, dark to extra white, 6, 7, and 8. Arrivals are about as usual for the season, when there has been a fair crop. *Beeswax.*—Yellow, 25; dark, 20.

R. A. BURNETT,

Nov. 9. 161 South Water St., Chicago, Ill.

ALBANY.—*Honey.*—Market is depressed under heavier receipts and lighter demand. The crop is turning out to be much heavier than represented, and the best price of the season has been made. We quote: White, No. 1, 14@15; No. 2, 12@13; mixed, 11@12; buckwheat, 10@11; common, 8@10. Extracted, buckwheat, 6½@7; clover, 8@8½.

Nov. 11. H. R. WRIGHT, Albany, N. Y.

CINCINNATI.—*Honey.*—There is no boom in the honey market, but demand is fair for extracted honey at 5@6c on arrival. There is also a fair demand for comb honey, at 14@16c in the jobbing way for best white in 1-lb. sections. Arrivals are plentiful. *Beeswax.*—Demand is good at 20@22c on arrival, for good to choice yellow.

CHAS. F. MUTH & SON,

Nov. 9. Cincinnati, Ohio.

MILWAUKEE.—*Honey.*—The movement of honey is slow, yet a steady consumptive demand exists. Choice white, 1-lb. sections, 14@15; 2 lbs., 13@14; old dark, 1 lb., 10; new dark, 1 lb., 10@11. Extracted, white, barrels and kegs, 7@8; tin and pail, 8@8½; dark, barrels, 6@6½; kegs, 6@7. *Beeswax* in demand at 22@23.

A. V. BISHOP,

Nov. 11. Milwaukee, Wis.

KANSAS CITY.—*Honey.*—White 1-lb. sections, 13@14; dark, 10@12; white, 2 lb., 12@13; dark, 10@12. Extracted, white, 7@8; dark, 5@6. *Beeswax*, none in market.

CLEMONS, CLOON & CO.,

Nov. 4. Kansas City, Mo.

ST. LOUIS.—*Honey.*—Market steady. Better inquiry. Comb, 12½@14 for choice; 8@10 for inferior. Choice extracted, 5½@6; dark, 5@5½. *Beeswax.*—Prime, 22.

D. G. TUTT GROCER CO.,

Nov. 11. St. Louis, Mo.

PHILADELPHIA.—*Honey.*—We have a clever demand for pure extracted honey, in small good-style packages, at 10@12½c; and fair demand for 1 lb. sections, at 14@16c.

PANCOAST & GRIFFITHS,

Nov. 5. 122 Dock St., Philadelphia, Pa.

DETROIT.—*Honey.*—Comb honey is selling quite freely at 13@15c. Supply is about equal to the demand. Dark or fall honey is more plentiful than white. *Beeswax*, 24@25.

M. H. HUNT,

Nov. 11. Bell Branch, Mich.

KANSAS CITY.—*Honey.*—White, 1-lb. fancy, 14; good, 13; dark, 11; white, 2 lb., 13. Extracted, white, 7; dark, 6. Demand good. Bee-men find sellers at above prices.

HAMBLIN & BEARSS,

Nov. 11. 514 Walnut St., Kansas City, Mo.

FOR SALE.—One ton of nice comb honey in 1-lb. sections. I want 12½ cents, on board cars.

CHAS. S. STRONG, Plymouth, Ohio.

FOR SALE.—White-clover honey in 63-lb. cans (2 in a case), or 12-lb. cans (10 in a case), at 8c, or 7½ in barrel lots.

H. W. TUNK,

Box 1156, Bloomington, McLean Co., Ill.

FOR SALE.—I have 6000 lbs. of fine light yellow honey, basswood and goldenrod mixed, in barrels, weighing from 200 to 600 lbs. What am I offered?

E. S. FOULKS, Grant Center, Monona Co., Iowa.

FOR SALE.—100 lbs. of buckwheat honey in 1-lb. sections, and 100 lbs. of clover extracted in tin pails, all at 9c. per pound.

H. A. HUBBARD,

New Lisbon, N. Y.

FOR SALE.—1000 lbs. of basswood extracted honey in 60-lb. shipping-cans, at 10 cts. per lb., and 500 lbs. of white comb honey in 1-lb. sections at 15 cts. per lb., delivered f. o. b. Address A. P. SHARP,

22d Exeter, Luzerne Co., Pa.

FOR SALE.—About 600 lbs. of A No. 1 basswood honey, 7c per lb., in barrels or 70-lb. cans. No charge for packages. You need not send for samples. I will guarantee it first-class in every respect.

H. O. McELHANY, Cedar Rapids, Iowa.

FOR SALE.—200 lbs. of No. 1 clover and 500 lbs. of heart's-ease honey, in 1-lb. sections, put up in glass-front cases holding 24 lbs. each. I will sell the clover honey at 13c, and the fall honey at 11½c per lb.

22d G. D. BLACK, Brandon, Buchanan Co., Iowa.

FOR SALE.—About 2500 lbs. of white-clover honey. About half of it is in 12-lb. cans, 12 in a box, and half in 60-lb. cans. Cans all screw top, and nicely labeled. How much am I offered for the lot on track here?

E. A. SHELTON,

22d Independence, Buchanan Co., Iowa.

FOR SALE.—I have a quantity of choice clover honey in scant 1-lb. sections, and 12-lb. cases, at 15c per lb. (100 lbs. or more). Also 60-lb. screw-cap cans of extracted clover honey at \$4.90 per can; 2 cans in 1 box, \$9.60. Safe arrival guaranteed by freight.

OLIVER FOSTER, Mt. Vernon, Linn Co., Iowa.

17tfdb

FOR SALE.—I still have about 4000 lbs. choice extracted white-clover honey. I have also about as much nice Spanish-needle honey, which I consider as fine as the best goldenrod. Write me for price list.

OUT-APIARIES, NO. XIX.

GETTING READY FOR WINTER QUARTERS.

IF you do not cellar your bees, the matter of getting the out-apiaries ready for winter differs nothing from the home work. If you cellar them, there may be a chance to put them in a cellar right where the out-apiary is located; but that is not so very likely. Possibly you may do well to build a cheap cellar or cave, perhaps after Doolittle's plan; only feel your way, for you are not sure that soil and other things are the same with you as with Doolittle. If the bees are to be hauled home you will do much the same as in hauling them out in the spring, only more care will be needed to avoid jarring or breaking down the combs, for they are heavier with honey and bees than in the spring, and a break in the fall is worse than in spring, for we want as much quiet in the fall as possible. Manage to have all handling of frames done some time before hauling, if you depend on the bees to fasten the frames. You are not so likely to have bad roads in the fall. As soon as frost has finished up fall pasturage, the bees may as well be got home, and at the latest they should be got home in plenty of time to have at least one good fly before going into the cellar. If the weather is quite cool you may be able to go at any time of day and shut them in the hives; but the probability is that you will need to go quite early in the morning for your first load, and wait till 4 or 5 o'clock before you can shut up your second load. If the weather is tolerably warm, you may find it best to fasten up your morning load when you go for your evening load; that is, fasten up in the afternoon twice as many as you can take at one load, and then you needn't be in such a hurry to start early in the morning. After frost in the fall, on a warm day the bees will be flying in good sea-

son in the morning, but will stop flying comparatively early in the afternoon, as they probably find nothing to do. If you want to haul three loads in a day, unless it is pretty cool you will not be able to shut up the bees at the time of going for your second load, and must shut them up in the morning, unless, indeed, you shut up all in the evening.

In the revised edition of Langstroth on the Honey-Bee, Dadant says: "We usually replace the bottom-board by a wire-cloth frame protected by slats. The entrance should never be covered with wire cloth, but should be entirely closed, for the old bees will worry themselves trying to get through it, and it will soon be clogged with dead bees." This probably refers to shipping bees long distances; but if your hives are so constructed that you can easily give them ventilation elsewhere, it may be well to have the entrance closed. Still, I have hauled hundreds of colonies with no ventilation except wire cloth at the entrance.

Upon bringing them home, place your hives conveniently near to the cellar door; and if you are much crowded for room, you can put one hive on top of another. I have sometimes piled them three high. Putting them in pairs also economizes room, and the pairs may be two or three high. If your ground is dry the hives need nothing under them; otherwise it is well to have something to keep the bottom-boards off the ground, if it be nothing more than two sticks of stove-wood under each hive. In setting out the hives in the spring they can be placed the same as they were in the fall—I don't mean each hive in the same place it occupied in the fall, but close together, two or three in a pile, near the cellar. If you use hanging frames, try to avoid all handling of frames for some time before hauling home, and until they are again placed in the out-apiary the following spring.

I don't need to caution you about being careful to

shut up your hives *very* securely, and look out for horses being stung, for you had some experience when you hauled them the previous spring, and very likely got into some trouble which made you wish you had never undertaken to haul bees. I may mention, however, that you have more bees in a hive in the fall, and, if there is any difference, they are crosser.

C. C. MILLER.

Marengo, Ill.

Friend M., your directions are exceedingly valuable. Every line indicates that you are writing from practical experience, and I think it will be well for the A B C class to read this chapter over and over.

A MODEL BEE-YARD.

FRIEND BOARDMAN TALKS TO US ABOUT HAVING THE GROUND CLEAN AROUND THE HIVES.

“THAT’S good enough, Ed. You may consider this job begun. You’ll not need to hurry; take your time for it, and peel the turf all off the yard as you have begun here. There’s nothing particularly driving now, and I believe this is a work that will pay well.

“The apple will be in bloom in about two weeks; and if it does not give the bees a lift I shall have to do considerable feeding. We shall be in time with this work, so that the ground will have a chance to settle and become solid so that it won’t get muddy if it should chance to be rainy about that time.”

The next day, toward night, as I came into the yard it presented a most ludicrous sight. The loose turf was rolled up in all conceivable shapes, and the alleys between the hives looked like a very roughly plowed field, with the hives planted down between the furrows.

“You have it all done, haven’t you, Ed? How much time do you think it has taken to make this yard look so horrid?”

“Oh! about a day and a half—not more than that.”

“Well, all right. I see you have to work with a veil on. This kind of work makes the bees a little cross. I wouldn’t blame them, if they take any kind of pride in their surroundings if they should sting every member of the human family at sight. But we’ll make this look better before we get done with it.”

“I’ll go to the cistern and bathe my eye where that little rascal stung me. Cold water is the best remedy for a bee-sting, I know of.”

“The yard is 60 x 85 feet, and contains at present 104 colonies. It would accommodate a much larger number without crowding. But I am not in favor of crowding colonies too close together. About 5 feet in the rows, with the rows 8 feet apart, gives a very convenient distance between the hives. I want ample room in the alleys to run a hand-cart or hive-carrier; and an open alley through the middle of the yard, wide enough for a wagon, is oftentimes very convenient.”

After enduring the sight of the yard in this torn-up condition for a few days, with no very good prospects for fair weather, nor sunshine enough to dry it out very much, I gave orders to have the turf gathered up and wheeled outside the yard, and dumped in a pile; and while this was being done I looked about and found a piece of crosscut-saw

plate, about 2½ feet long, which I carried to the blacksmith, and with his help I got up a tool to level and smooth the ground after the turf was removed.

BOARDMAN’S SCUFFLE-HOE, FOR CLEANING WEEDS AND GRASS FROM BEE-YARDS.

It was made by riveting a clift-shank upon the flat side of the saw-plate, so that a handle could be put on, and at the same time extending along the plate far enough to give the required strength. To this I attached a handle about 5 feet long. I called this tool a scraper. It has proven a most valuable and efficient tool, and about the only one needed to keep the yard in order. The expense of getting it up was, I think, about 30 cents to the smith, and a little not over-valuable time of my own in putting it together, not including any thing for the invention. If any bee-keeper should want one—please don’t hesitate about making it. It is not patented, nor shall I charge any thing for priority of invention.

I was now ready for business. As I returned to the yard with the new scraper on my shoulder, the first object that met my sight was a huge mound of fresh dirt and turf, and Ed was posing upon its summit, holding a four-tined fork with which he had been at work, reminding me very much of the statue of Jove holding the thunderbolts in his hand.

“Hello! what have you here? This is a specimen for you.”

“I’ve got the bee-yard skinned, and this is the skin rolled up here. You are a taxidermist, and I thought may be you’d want to stuff and mount it.”

“Never mind. I consider it properly mounted now. I’ll tell you how I will dispose of it. I’ll use it in the garden, and I think it is worth all it has cost to remove it for that purpose.”

The new scraper even surpassed my expectations at the first trial, and it was not a long job, nor a hard one, to scrape the yard smooth and level in every part until it looked like a model croquet-ground. I was much better pleased with the job than I should have been with the first plan of making a dooryard for each colony, for now the scythe could be dispensed with entirely. It is the first time in my whole experience with bees that I have been entirely satisfied with the preparation of the ground in the bee-yard. I had some apprehensiveness that the ground would be muddy when a long rainy spell came; but my apprehensions were unfounded. It proved always, even during a long drizzling rain, much more pleasant working than on the grass ground. Of course, the ground is tiled, which helps to keep it dry, and no water can stand

"Now, Ed, that colony over there, C. L. is queenless; give it that nice frame of brood you have just taken out, and put this empty comb in there in its place."

on the surface more than a few minutes. Don't imagine now, that this excellence will be durable without labor and care. The new scraper hangs up on the side of the bee-house, where it is handy; and as often as it is needed it is run over the ground, which grows hard and smooth, and the weeds and grass disappear.

Now, my brother bee-keepers, I should like to have you see for yourselves the place I have been describing, and how pleasant I have made my apiary for myself and my bees. I would send you all a card of invitation to visit me, but I fear you would think this too much trouble, and so I have had a nice picture taken, showing a portion of my apiary, and have sent it to friend Root, who, may be, will show it to you in GLEANINGS. If he does I shall have the pleasure of presenting to you my model apiary, as well as myself and Ed. If I am sure you are anxious to know, I may some time tell you the advantages of keeping an apiary clean.

H. R. BOARDMAN.

East Townsend, Ohio, Nov. 1, 1889.

Friend B., we were exceedingly interested in that new instrument for keeping the ground clean. Although you do not say so, I presume the saw-plate is ground sharp all around, so as to be pushed and pulled like a scuffle-hoe. By the way, a scuffle-hoe will do more of this kind of work in an hour than a common hoe or any thing else will in half a day, if it is kept sharp, and used right. Your yard certainly looks very clean and nice in the picture, and the artist has given both you and your assistant so faithfully that we should almost know you from the picture.

WORKING FOR COMB HONEY.

DOOLITTLE TELLS US HOW HE DOES IT.

A CORRESPONDENT wishes me to give in GLEANINGS an article on how I work for comb honey. Although a little out of season, I will try to please him, for perhaps some may wish to arrange a few hives this winter to try my way of doing it. In order to make all plain, I will say that the hive which I use mostly is 24 inches long, 12 inches wide, and 12 inches deep. As the frames are but $11\frac{1}{2}$ x $11\frac{1}{4}$ inches square, they must, of course, go in the short way of the hive. Five inches from either end of the hive is placed a slotted division-board $\frac{1}{4}$ of an inch thick, which I used to use when I used side boxes in connection with the top boxes, and which comes very handy with my present management. This leaves a space of $12 \times 12 \times 13\frac{1}{2}$ inches for a brood-chamber in which 9 Gallup frames can be used. The front and rear of the hive is protected by 4 inches of chaff or fine straw, which is always left in place summer and winter. The entrance to the hive is a $\frac{3}{4}$ -inch slot cut from the bottom of the hive the whole length of the brood-chamber (or $13\frac{1}{2}$ inches long), and is regulated by entrance-blocks. At all times of the year, except the latter part of spring, as will be explained further along, the five-inch space on either side of the brood-chamber is closed by a strip of common cotton cloth being spread over the frames and down each side over the slotted division-boards. The five-inch space is now filled with a chaff or sawdust cushion, which is made so as to just fill the same, using one on either

side. When the bees are being prepared for winter, the sections are taken off, the ends of the cotton strips folded back over the frames, and a chaff or sawdust cushion, large enough to go over the whole top of the hive, chaff sides and all, is put on. Thus the bees are left during the winter, whether placed in the cellar or wintered on the summer stand. When spring arrives, the bees in these hives packed with chaff, etc., are stimulated by any or all of the ways familiar to the apiarist, till the nine frames are filled with brood. As the weather is always changeable in the spring and early summer, the chaff packing is a great help to the bees, by way of enabling them to maintain an even temperature, and thus the hives are filled with brood a little earlier in the season than they otherwise would be. As it is still too early for swarms to issue to the best advantage for the production of honey (the honey harvest not being yet at hand), and desiring all the bees possible at this season of the year (these bees are in reality our crop of honey), I remove the chaff cushion and cotton cloth from one of the five-inch spaces, and place three frames of brood, taken from the brood-chamber, beyond the slotted division-board, placing empty combs in the brood-nest in place of the removed frames of brood. In a week the other end of the hive is served in the same way, if the queen is prolific enough to lay as many eggs as such a course will require, which gives me, as will be seen, 15 frames in a hive, thus securing a large force of bees, with no disposition to swarm thus far. As the brood in the frames which are set over in the five-inch space should be sealed over when set there, it will be seen that, in 12 days, the brood should be all matured; and as the queen rarely goes into these spaces to deposit eggs, we have these combs devoid of brood, or nearly so, when the flowers begin to secrete honey. They can now be taken out and reserved for new swarms. If any of the combs I wish to take out still have brood in them, they can be used in building up weak colonies if we have such, or they can be placed in the upper stories to such hives as we are working for extracted honey, where they will be filled with honey as soon as the few bees remaining in the brood form are hatched. Meantime, if the flowers begin to yield honey of any amount larger than is consumed in brood-rearing, I put on the wide frames over the brood-chamber part of the hive, so the bees can go in them to store this first honey.

When I have decided that it is time to put on the sections, I take out the six combs which are beyond the slotted division-boards, place back the strip of cotton cloth and the chaff cushion in the same position they were in for winter, with the exception that the part of the cotton cloth which then went over the top of the brood-frames is now folded back over the cushions, when the queen-excluding honey-board is put on, which extends out over these side cushions to the sides of the hive. The wide frames of sections that had been on the hive before, if any had been put on, are now placed over the brood as before, while more are added at their sides, to the amount I think the colony will need. If none have been on the hive, then "bait sections," or those filled with empty comb, are placed immediately over the brood-nest to tempt the bees into the boxes at once. It will be easily seen, that the sections will be filled with bees at once under the conditions which now exist; and

that, if the flow of honey is good, it will not take long to have our bait sections filled, and work well commenced in the others.

Now, to secure the most honey for the rest of the season, I proceed as follows: When a swarm issues from a hive, the old colony is moved to a new stand, and the swarm hived on the old stand, which secures us nearly all the working force from the parent colony. The sections are now taken from the old colony and carried to the new hive. In this new hive are placed only six Gallup frames, and the rest of the hive filled up with dummies so as to contract the size of the hive to the real wants of the queen at this time. The work done by a swarm thus treated for the next ten days is almost marvelous, being far more than can be secured by any other plan which I know of. These six frames give plenty of bees for winter, and, often, enough honey. If not, they must be fed, of course. The old colony will build up in good shape for winter, and often give many combs of honey for extracting or giving to those which have been contracted as above. As full sections are taken out of the middle of those on the hive, the others on the outside are drawn to the middle, and more empty ones placed at the sides, and so on to the end of the season. This getting the bees in the right condition for the harvest may be called by some, "Doolittle's hobby." If so, 'tis well, for I believe it one of the best hobbies ever ridden upon by any one producing comb honey.

G. M. DOOLITTLE.

Borodino, N. Y., Nov. 5, 1889.

MANUM IN THE APIARY WITH HIS MEN.

ESTIMATING STORES PREPARATORY TO FEEDING.

SEPT. 15.—"Well, Scott, we have now got the honey all off to market, and every colony supplied with a queen, so far as we know; and now we will commence to prepare the bees for feeding, and we will take the furthest yard first, while the roads are good, as you and I are alone now to do this work, except what little Fred may have time to help us after he gets the farmwork done.

"Jennie, you may put up dinners for two; and you, Scott, may be harnessing up old Bill while I hunt up the veils and wristers, as we may need them. I always like to have them with me in case they are needed, as the bees are liable to be cross at this season of the year. How nice it would be for us if they were getting a little honey—just enough to keep them even good-natured.

"There, here we are, ready for work. We had better put on these wristers, in order to keep the bees from crawling up our sleeves, as they will surely do without them. They are cheap-looking things, but they answer every purpose. They are made of cotton stocking-legs, with a rubber cord hemmed in the lower (or ankle) end of the leg. These are drawn over the coat-sleeves thus. There, you see the cord hugs tight to the wrist, preventing the bees from getting under them, making it much more comfortable in handling bees when they are cross. I will try to work without a veil, as I dislike so much to wear one, on account of my eyes; but you had better put yours on.

"I will now look over two or three colonies, and estimate the honey, and arrange them as I want

them while you look on, then you can go by yourself.

"There, now I remove the cover—or honey-board—very carefully, so as not to excite the bees any more than I can help. You observe that the combs are not all covered with bees. As it is a little cool this morning, the bees are clustered quite well. Now I think I can remove two combs from this hive, leaving ten, which will be all that should remain in this hive. I will place the two combs in this carrying box, to keep them away from the bees; and when the box is full I carry it to the honey-house and empty it, as great care must be taken at this season of the year not to expose any honey or even empty combs, as it takes but very little to set the bees to robbing.

"There, now, we have the space of the two combs to work in, and I will show you how I estimate their stores. I take out the combs one by one, and reckon up the amount in each comb, thus: First comb. This has honey on only one side, occupying about half the surface. If the other side were as well filled it would contain about two pounds; but as it is, I call it one pound. I now place this on this side of the brood-box, in order to keep the vacant place open, made by the removal of the two first combs. The second comb, as you see, has about two pounds and some pollen. We have now three pounds, third comb, some brood, and two pounds of honey, making five pounds. The next three combs, some brood, and so little honey I do not count it in. The sixth comb has pollen and two pounds of honey, making seven pounds. The next comb has three pounds, making ten pounds, and the next two have about three pounds each, making sixteen pounds, and the last comb you see is well filled on both sides, and contains probably four and one-half pounds; but I figure it at only four pounds. We therefore find that this colony has at least twenty pounds of honey, so I mark on this record-board (kept in each hive), "Twenty pounds." Now, when we come to feed this colony we will give them ten pounds of syrup, making thirty pounds for their winter stores, as that is the amount I want each colony to have. I now place the combs back to the further side of the brood-chamber, and put in a division-board next to the combs. There, now you see they have much closer quarters than they had before. I now replace the honey-board.

"I will now mark in this book, which I carry in my pocket, ten pounds, under the head of 'yard No. 6, short,' so that, when we get through, we may know just how much we shall have to feed this yard. Now, this second colony has less bees, so we will remove three combs, leaving nine; and as you see they have only eighteen pounds of honey, we shall have to feed this one twelve pounds of sugar.

"This third colony is strong in bees, but the honey is pretty well divided in all the combs. I will remove but one comb, as that will give space enough to spread the other combs apart all that will be necessary. There, you see I make these eleven combs occupy the same space that the twelve did."

Scott asks:

"I have noticed, Mr. Manum, that you spread the combs further apart than they were. Why do you do that?"

"Yes, Scott. I do that for the purpose of giving the bees more space between each comb, to cluster in. I believe they will keep warmer, and consume less honey, by giving them a chance to form a

larger cluster between the combs. I may not be correct in this, but it seems to me that it is better for the bees."

"Here, Mr. Manum, is a light colony. There are only four spaces filled with bees. What shall I do with it?"

"Wait a moment, Scott, until I get through with this one, and I will show you. Sure enough, they are light, and that is not all. They have no honey. Why! they have been robbed, so I will remove all but five combs, and unite with them two of those nuclei we brought with us. There, set in the combs from the nuclei, with the bees adhering to them. Now they have plenty of bees, and twelve pounds of honey, so we shall have to feed this colony eighteen pounds. They may quarrel a little, but I hardly think they will very much after this dose of peppermint-water.

"There, Scott, we have them all looked over; and I find, by figuring up, that we shall need to feed 1450 pounds of syrup, which means about 850 pounds of dry sugar."

Scott asks, on the way home:

"How do you prepare your sugar for feeding?"

"Well, in the first place I buy the fine granulated sugar. I prefer the fine to the coarse, because it dissolves so much quicker; and as it costs no more, and is just as pure, I prefer it to the other. I have used coffee A sugar, which I think is just as good for the bees; but as there is no saving in dollars and cents by using it, and as it is so liable to harden in the barrels, making it sometimes very difficult to dig it out, I have of late years used granulated altogether. Now, in making the syrup I proceed as follows: To 35 pounds of sugar I use 14 of hot water, 1 ounce cider vinegar, and 1 teaspoonful of salt. I put the sugar into a large tin can, then add the vinegar and salt, and then pour on the water and stir until the sugar is all dissolved. Then the syrup is poured into tin cans, with tight-fitting covers, and it is carried to the different apiaries and fed to the bees, though to the furthest yards the dry sugar only is taken and prepared and fed out there. I feed each colony from 5 to 10 pounds at a time, just at night, when it is warm and pleasant; but when the weather is lowery, so the bees do not fly much, we are able to rush the feed to them all day. Hence I prefer warm lowery weather for quick work.

"This year we shall have but very little feeding to do, as there is nearly honey enough in all the other apiaries to winter the bees by dividing it among them, as some of the colonies have more than they need."

Scott asks:

"What do you use for feeding the syrup to the bees? You do not pour it into the feeders with a dipper, do you?"

"Oh, no! I use a common tin tea-kettle—the largest I can find. I have had tin pots made for the purpose, but nothing suits me better than a large tea-kettle. With one of these I can feed 100 colonies 1000 pounds of syrup in two hours, and make out the records to each hive.

"Well, here we are home again. As there is a little time before dark, you may prepare a few nuclei to take with us to-morrow, as we may find now and then a colony that will need a queen or more bees."

NOVEMBER 1.

"Well, Fred, we are left alone now to pack the

bees for winter, and we had better go right at it and have it done. We will pack the home yard today. I will carry out the sheets for covering the frames, while you carry out the cushions. There, I will show you how to fix one hive, then you can take the next row.

"First, remove the brood-box cover and shove it under the hive to keep it dry. Now take this cotton-cloth sheet and spread it over the frames (no bridge sticks across the frames, as my frames are so small the bees can go around them); now take this enameled cloth and spread that over the cotton cloth, black side down, in such a manner as to cover half of the brood-chamber—the back half—thus leaving the front half covered only, with the cotton sheet, which leaves a chance for upward ventilation, and for the moisture to pass up into the cushion. I now put on the cushion over all; and as the cushion is large enough to completely fill the outer case, there seems to be but little chance for the cold to get to the bees.

"Now put in the entrance slide, which cuts the entrance down to 2 inches long by $\frac{3}{4}$ wide. Now we will drive these stakes in the ground, one on each side of the hive, and tie this twine, one end to each stake, after passing it over the hive; this will prevent the hive from being blown over. There, now, this hive is all fixed for winter, and is to be let alone until spring, unless there should come a warm spell so the bees can fly. If so, we will simply pull the entrance-slide to see that the entrance is not clogged, and the slide is returned at once. This is just the right kind of weather for this work, as it is cool enough so the bees are nicely clustered below the top-bars, and yet not so cold as to make it uncomfortable to work bare-handed." A. E. MANUM.

Bristol, Vt.

Friend M., I never before heard of salting winter food for bees; but as we have plenty of demonstration that the bees like salt, I think very likely it will do them good. Our friend Betsinger claims that it will keep away foul brood. I wish it were true. We should infer that you have tremendous winds in your locality. May be it is the hives that stand on the hill that require to have the covers staked down; and, by the way, do you winter outdoors? One might infer so from the fact that you give each colony 30 pounds of sealed stores. My experience has been, with chaff hives, that 20 pounds is a great plenty, while those who winter in cellars get it down to 15 or 18.—Our first apiary was made with the intention of having the ground always kept clean between the hives. As soon as weeds made their appearance it was scraped over with a sharp hoe, and then swept clean with a broom. This gave it a very neat and tidy appearance; but it required so much work that we thought we could not stand it. Where an apiary is kept so clean, any thing dropped on the ground looks untidy. Even a discarded queen-cell, trimmings from the grapevines, a bunch of clover or grass used to brush the bees off the combs, or any thing of the sort, must be gathered up and swept away in order to have it look pleasing to the eye; but I confess that the pleasure of working in an apiary that is always kept perfectly clean and neat is worth a good deal, to say the least.

HONEY FROM ALFALFA.

REPORT FROM NEVADA, OF HONEY RAISED SOLELY
BY IRRIGATION.

WE have with us to-day Mr. W. K. Ball, of Reno, Nevada, who brings us some samples of comb honey, as handsome as any ever produced from white clover; and, allowing A. I. Root to be judge, of as fine a flavor as any honey from white clover. This honey was all gathered from alfalfa fields, kept growing solely by irrigation. As Mr. Ball sits in a chair near myself and the stenographer, I propose to ask him some questions, and have the stenographer take down his answers.

"Mr. Ball, how many colonies of bees have you now?"

"Well, I should say between 200 and 300 stands."

"How many had you to start with in the spring?"

"I started in with 125."

"How much honey have you secured, like the sample you have shown us?"

"I have taken 12,000 lbs. of comb honey."

"And about how much extracted?"

"I extracted between 4000 and 5000 lbs., the past year."

"What was your best yield from a single colony?"

"My best colony gave me about 250 lbs. of comb honey, such as you tested."

"About how many acres of alfalfa are there, say within two miles of your apiary?"

"Well, it is pretty hard to say. It is all alfalfa to the east, and to the west it is mountains and table-lands."

"How many other bee-keepers are there near you, keeping, say, a hundred or more colonies?"

"There are none keeping over a hundred colonies, but quite a large number keep a few bees."

"Are they all doing well?"

"They are all doing well when cared for."

"About when does the first bloom from alfalfa begin?"

"Well, generally about the first of June."

"How long does this first period of bloom last?"

"I should say about a month; but sometimes it hangs on for six weeks before they cut it."

"They cut it while it is in bloom, do they?"

"Yes, when in full bloom."

"After they cut it, the honey-flow is done, is it?"

"It stops for a few days, and then it starts out again. This year it was about a month before we got another honey-flow."

"Do you know whether, when they depend on irrigation solely, alfalfa yields every season if irrigated?"

"Yes, it does. It never fails. Of course, we have grasshoppers occasionally that eat it up for us."

"When does the last crop begin?"

"Sometimes it commences as late as September. This year I think it was a little earlier."

"Well, now, Mr. Ball, there is another

point that comes in here: Do they all cut the alfalfa about the same time?"

"No, not generally, though they did so this year. During the month of July the honey-yield was not large; still, they gathered honey all the time, and they did fairly well."

"Now, then, if a bee-keeper had control of the alfalfa fields, could he manage to have a continuous flow of honey from June or earlier, till—"

"Yes, till the 20th of September. I am going to have that."

"The alfalfa always yields honey, you say?"

"It does, every time."

"Mr. Ball, can you give us any remote idea as to how many acres of alfalfa would be required to keep 100 colonies of bees busy?"

"Well, I don't know. Alfalfa is just a perfect mass of blossoms. It is just as thick as any thing can be; but I have no idea of how many acres would be required for any given number of colonies. We have but few bees, and they can't begin to gather what there is. I am pretty sure there is enough for a thousand colonies of bees."

"Without question, 100 acres of alfalfa would keep 100 colonies of bees busy, would it not?"

"No doubt about that, at all. I thought that 20 acres would, in full bloom."

"If what you say is true, then it is quite probable that the great field for bee-keepers has almost, as yet, been unexplored and undeveloped?"

"Yes, sir; it is."

"How about the expense of irrigation?"

"Well, where they buy water, they buy it of the companies, and it costs about \$4.00 an acre to water the land, and each acre yields from five to seven tons, but sometimes only three."

"What is land worth per acre, suitable for raising alfalfa?"

"Under cultivation?"

"Well, both ways."

"They value land at about \$100 per acre, and the water goes with the land. Uncultivated land without water—well, the idea is, the land is of *no value* without water."

"What could land be bought for without water—say for raising sheep?"

"I don't know. It is very cheap. I have not bought any. Perhaps \$1.25 an acre. Land that is watered is higher."

"After arrangements have been made for getting water on this land that is worth \$1.25 per acre, how much expense is required to get in a crop of alfalfa—that is, how much per acre for the first crop?"

"About \$4.00 clearing the ground of sage brush, or not more than \$10.00, seeding and all, on good ground. The first ditch is very expensive."

"What is done with such immense quantities of hay?"

"Oh! it is fed to cattle, there in the valley."

"How often is the land irrigated in a year, for alfalfa?"

"Well, that depends a good deal on the

land itself. Some land is irrigated only twice for a crop of hay, and some more."

"You have rain in winter, do you not?"

"Last year we did not have enough, and so we ran very short."

"How much water is required per acre?"

"An inch to the acre, right through."

"Mr. Ball, what are we to understand by an inch?"

"An inch is what will run through an inch hole under six inches pressure—that is, a steady run, day and night."

"What is the nature of the soil of these alfalfa fields?"

"Well, alfalfa does best on sandy or gravelly soil. On such soil it runs its roots down 80 feet along the river-banks."

"Mr. Ball, I heard it said in California, Arizona, and other places on the desert, that any of the desert land would raise nice alfalfa, provided they could have plenty of water."

"That is true—there is no discount on that. Alfalfa will grow any place where there is water."

"Then Horace Greeley's wild vision, as some have termed it, of reclaiming the Great American Desert, needs only water to bring it about."

"That's a fact."

"How much winter do you have, where these great alfalfa fields are?"

"Sometimes as low as 10 degrees below zero."

"Why can't we raise alfalfa here?"

"Why, you have too much rain. You see, the idea is, alfalfa will not stand water except for a few days at a time. It kills the head, and then it dies."

"Alfalfa, then, is rather a plant of the desert."

"Yes, it is."

"I had that idea."

"You can kill a whole field of alfalfa by letting water run on it for two weeks steady. We change the water every 24 hours. Four hours a day is plenty."

"How long does it take to irrigate, say an acre of alfalfa, with the water that runs through an inch hole, under a pressure of six inches?"

"You can not irrigate a single acre with a square inch. You need a pretty good stream. You can irrigate ten acres with a ten-inch stream, but you can not irrigate one acre with a one-inch stream. The sun would lick up the small stream by the heat; but a ten-inch stream would keep ten acres going very well."

"It needs, then, ten inches of water to do any thing?"

"Yes, sir."

"How long does it take to irrigate an acre where you have ten inches of water?"

"Ten inches will irrigate one acre in twelve hours."

"What is alfalfa seed worth per pound or bushel with you?"

"When I left, I think it was worth about 10 cts. a pound. It runs about like red clover—say 60 lbs. per bushel. We don't use *bushel* very much. We buy and sell by the pound almost altogether. We use no water

in the winter. We shut it off in the fall, when cold weather comes."

"How soon do they commence irrigating in the spring?"

"When they get the ditches cleaned, and put on the water in the spring—say about the middle of April."

"How much seed per acre is required?"

"Well, I think about 20 lbs. Sometimes a little more or a little less would do."

"In raising seed, you have to let alfalfa ripen, do you not?"

"Yes. You can get two crops of seed in one season."

"How far apart are the furrows, for irrigation?"

"About three feet."

"About how deep?"

"Well, three or four inches—just enough to keep the water in the furrow."

"How do you make furrows after the first crop is cut?"

"They furrow about once a year. The more you harrow it over and dig around it, the better it grows. A good many harrow it every spring. It makes it grow better."

"Is this alfalfa ground level, or nearly so, or is it on a hillside?"

"Both. They can irrigate it on hillside just as well as on the level ground."

"How do you know when there is water enough?"

"As soon as it runs over the ground, there is water enough."

In addition to the above, I would say that Mr. Ball has pretty nearly a *carload* of this beautiful alfalfa honey. Ernest has just tasted it, and agrees with me that it is equal to any honey in the world. Mr. Ball proposes to use about half a carload of supplies during 1890, himself, and he may be able to make up a whole carload among his neighbors. So you see these great alfalfa fields are going to open a big industry in this matter of supplies. Now, we are not all selfish in our enthusiasm in this matter. There is a great opening for energetic supply-dealers right *on the spot*. It is poor policy to ship lumber thousands of miles, and over mountains, if it can be avoided. The resources of all these new fields should be well looked up and developed.

THE WIDTH AND THICKNESS OF TOP-BARS.

THEIR RELATION AS AFFECTING THE BUILDING OR THE PREVENTION OF BUILDING BURR-COMBS.

WITHIN the last few months there has been considerable said about the prevention of burr-combs above and between top-bars by means of having the top-bars of unusual thickness up and down. The first that I remember of hearing of any thing of the kind was at the national convention at Toronto, when that bright Canuck, J. B. Hall, of Woodstock, Ontario, showed me his top-bars, which were, if I remember rightly, one inch square. I did not feel particularly interested in the matter at the time, because I had on hand a large number of frames, and I would not change any thing of the kind without very strong reasons. Besides, I had no trouble with burr-combs, for I used the Heddon slat honey-

board, which kept the bottoms of sections placed over the brood-frames entirely clean. I have always valued highly this slat honey-board; but within the past three years it has gradually failed to be effective, and the present year I have had bad work with combs and honey filled in between the slat honey-board and the bottoms of the sections. In former years every section was entirely clean from burr-combs. Why the difference? The only explanation I can think of is this: In former years, before putting on the honey-board I scraped off clean the tops of all the brood-frames, and cleaned off the honey-board at the close of the honey-harvest. Latterly I said the bees would only have extra work to fill again these spaces, so I left all the burr-combs on. You may be sure I shall clean them off next year. So if you use the honey-board, profit by my experience, and, before putting it on next summer, make a thorough job of cleaning off all propolis and wax above the upper surface of the top-bars. Perhaps I may do well to tell you how I have done it.

I take a common garden-hoe; and while an assistant blows over the top-bars just enough smoke to keep the bees down out of the way, I hoe off every thing, leaving the top-bars clean. The hoe also makes rapid work in cleaning off the honey-boards. Lay them down inside a shallow box, or in some way so they are held firm; and after you have hoed them off, clean out the spaces between the slats by means of a flat garden-trowel, which may be used, indeed, for the whole of the cleaning. If the honey-boards are cleaned off immediately upon taking from the hives, you will have a sticky mess, and may have trouble with robbers. To avoid this, loosen up each honey-board a day or a week before taking off. Pry it up at different points, so that you are sure you have broken loose all attachments, and then leave it closed up as before, and in 24 hours no honey will be found on the honey-board.

But, to come back to my starting-point. I am quite anxious to know whether thick top-bars will allow me to dispense with honey-boards entirely; for notwithstanding the high value I have set upon them, there is no denying the fact that they are decidedly in the way when you want to lift out frames; and from my experience I think they must be taken off and cleaned at least once a year, which is no little trouble. I think the editor made the objection to thick top-bars, that he didn't want to use any unnecessary wood; but, pray, isn't there any extra wood in the honey-boards? Besides, thick top-bars are less expensive and more substantial, and surely there is less machinery about them. I should really like to know why a honey-board prevents the building of brace-combs. Some claim that it is the break-joint principle. This year I have given considerable attention to this point; have had many cases in which there was no break-joint, but the space between the top-bars corresponded with the spaces of the honey-board, and I could not see that the break-joint was any better than the continuous passage. I wonder if it is not the simple matter of distance that prevents the bees from starting brace-combs. In my hives, the top-bars are $\frac{3}{4}$ thick, then a space of $\frac{1}{8}$ between top-bar and honey-board, and another $\frac{3}{8}$ space between honey-board and the bottom of the section. Now, this upper space is so far from the brood-comb that the bees may not care to fill up so small a space;

but after the space between the top-bar and honey-board is all filled up with comb and honey, the bees may next turn their attention to filling up the upper space, which is now only one-third as far above filled comb as it was at first. Now, if the matter of distance be all that is needed to prevent building, then the thicker top-bar may better be used than the honey-board, with no danger of its becoming inoperative. If any have tried the thick top-bar, and found it a failure, I should like to see it reported.

WIDTH OF TOP-BARS.

My top-bars are one inch wide; and if I should make any change in thickness, I might also change the width, if $\frac{3}{4}$ be a better width. I should like to know just in what way $\frac{3}{4}$ is better than one inch. I am a little afraid that, in hauling without fastening, the narrow top-bars might not hold so securely in place.

C. C. MILLER.

Marengo, Ill.

P. S.—Since writing the above, I heard Heddon and Hutchinson say they never clean off their top-bars, and yet have no trouble. That leaves me all at sea again.

There, friend Miller, you have brought up a subject that I have been thinking of for some time. I had intended to experiment with thick top-bars, but somehow I did not "get round to it." Mr. Danzenbaker, of Washington, D. C., when at Medina a year or so ago, said he had used these thick top-bars in his hives very extensively, and that they did prevent brace-combs. Now, if Mr. Hall and Mr. Danzenbaker, and others who have testified to the value of these thick top-bars, are correct, I do not see but that the honey-board will have to take a back seat—at least the plain slatted board, for I should a good deal rather have the extra wood in the top-bar, than in some extra contrivance. Will Mr. Hall, or Mr. Danzenbaker either, please let us know whether the thick bar *still* does away with the building of brace-combs, partially or entirely? We have always, at the Home of the Honey-bees, been in the habit of scraping the honey-board and the brood-frames before putting on the honey-board. For this purpose we have used a common garden-trowel, both sides of which had been ground to a sharp cutting edge. The hollow of the trowel holds the scrapings for one whole hive; and during the operation of scraping, no bits of comb drop in between the frames. With your hoe you can doubtless do it much more rapidly. You speak about the *width* of top-bars. For the past two or three seasons we have been using a hive with top-bars $1\frac{1}{4}$ inches wide, but only $\frac{1}{4}$ inch thick. Quite accidentally this season we noticed that few or no brace-combs were built above these top-bars. Had it not been for the fact that two or three correspondents had reported a similar observation, I should have thought no more about it than that it was the peculiar condition of the colony. Now, while I do not propose to advocate or even intimate that a *wide* top-bar would be advisable, I should like to hear from those who have had opportunities for experimenting in this matter. I know the general verdict is most strenuously in favor of a top-bar $\frac{1}{2}$ inch wide. This being the width of the average brood-combs, and also being a very convenient thickness

of lumber, has had a good deal to do in deciding on the width. Practical articles on this matter would be very acceptable just now. We should also like to hear from others, whether brace-combs are sometimes built through the honey-board, as Dr. Miller explains, and whether such building through is frequent, or only of rare occurrence. In regard to the break-joint feature, I never could see that such arrangement of the slats made any appreciable difference one way or the other, and I have watched the thing in our apiary quite closely. There were, so far as I could observe, just as many brace-combs when the slats were break-joint as when they were not. ERNEST.

In addition to what Ernest has said, I would say that I well remember friend Hall's thick top-bars. I think it was the first intimation that ever came to my knowledge, that having the top-bars very thick would answer the same purpose as the honey-board in discouraging the building of bridge-combs up against the sections. I told him, and I can not help thinking now, that getting the bees so far away from the brood would not only discourage bridge-combs, but it would discourage them from going into the supers. There has been a great deal of complaint already, that full-blooded Italians are slow to commence in the boxes. Now, is it not true, that, the further we get surplus sections from the center of the brood-nest, the more we increase this difficulty?

J. M. JENKINS.

A SKETCH BY A FRIEND.

J. M. JENKINS, of Wetumpka, Ala., is a native of that State, and was born Jan. 17, 1856. His early boyhood was attended with many incidents of an interesting character, which, for lack of space, we must allow the reader to learn of by cultivating a more intimate acquaintance with him. When he was but fifteen years old his father was killed by the explosion of a boiler in the sawmill of which he was part owner; and, as is frequently the case with the widowed and the fatherless, the settling-up of affairs was so managed in the interests of others as to deprive them of their rightful share in the property, and they were left with but small means at their command for support.

The family now consisted of the mother, the son, and two younger sisters. With more keen perception of duty than is usually found in a boy of his age, Master Jenkins realized that the cares and responsibilities of becoming the *man* of the family practically devolved upon him.

At this time of life he was slight of build, and rather delicate in health; but he bravely put forth his best efforts to fill the place so sadly made vacant. The family were living upon a farm at the time, and, naturally, the efforts of our young friend were first turned in this direction; but his good will and purpose far exceeded his physical ability, and farming was not a success. The mother, in her faithful love for her children, and purpose to keep the little band together, finally decided to move to Birmingham, Ala., with a view to bettering their condition. From early childhood

the boy had manifested a great love for machinery, and it was his ambition to learn a machinist's trade, and to eventually become an engineer. Having a fixed purpose in view, he sought a position in this line; but being a stranger, and without influence, he was unsuccessful in his efforts to find an opening. At last a chance acquaintance, learning of the boy's eager desire for employment, offered him a job in the round-house of the Louisville & Nashville R. R., at Birmingham, as a wiper. For the benefit of our young readers, especially the boys, I will explain that the duties of this position required him to wipe off the grease and dirt from the locomotives as they came in off the road; draw the fires, fill the sand-boxes, shovel the tenders full of coal, load on wood, turn the engines on the turntables, and fire them up for the outgoing trips. Now, this was all hard, dirty work, and I fear that some of our boys would shrink before such a task. But our young friend was resolute in his purpose;

J. M. JENKINS.

and as this opening was in line with his ambition to become an engineer, he gladly accepted the position at \$1.25 per day. Considering his age (seventeen) and his slight build, it is a marvel that he ever endured the work; but his true pluck manifested itself to such a degree that the company, recognizing his worth, offered him a position as fireman on a locomotive, at the expiration of five months' service in the round-house. Many predicted certain failure for him here, on account of the arduous duties; but again he was victor of the situation. Wholly upon his own merits he rapidly arose in the estimation of the company, and, having become thoroughly competent to run an engine, at the age of twenty we find him running a switch-engine. In 1878 (now twenty-two years old) he was put upon the road as a full-fledged engineer. As an evidence of the high esteem in which he was held by his company, two years later he was tendered the

branch road which runs between Wetumpka and Elmore, in preference to many older engineers who had been longer in the service of the company. This is considered the most desirable run that the road now offers, and for nine years past Mr. Jenkins has enjoyed the advantages which this position offers.

In 1879 he was happily married to Miss A. E. Angell, of Tennessee, and the partnership proved to be a rich blessing to him. Added to the charm of quiet, pleasing manners, Miss Angell brought with her into the home life the sweet grace of a pure Christian heart, and it was through her influence that our friend and brother was led to a realizing sense of his obligation to the Father of all mercies and blessings; and from a life of thoughtless indifference to such matters he was won over into the pure light of the gospel, and the household was established with a prayer for divine guidance and blessing, and the family altar is now a feature of the home. Through the same loving influence he was induced to give up the habit of smoking, and, to use his own words, he now thanks God daily for his goodness to him in sending him such a wife. Their marriage has been blessed with four lovely children—two boys and two girls, and the sunshine of love and happiness sheds its radiance over the family circle.

About seven years ago Mr. Jenkins became interested in our favorite subject, the bees, and studied it with an earnestness which bespoke a mastery of the art. He afterward became desirous of engaging in the supply-business, and made a proposition to Uncle Amos to establish a branch of the "Home of the Honey-Bees" in the South. Mr. Root did not seem to favor the plan in just that form, on account of freights, etc., and, with characteristic tenacity of purpose, Mr. Jenkins determined upon starting out on his own responsibility.

Purchasing an engine and suitable machinery he started a factory, and in 1886 issued his first catalogue; and our friends all through the South have been greeted each year since with as bright and neat a publication of this character as may be found. From a small beginning our brother has advanced until now his business represents an investment of from two to four thousand dollars.

His business standing is one of unquestionable integrity, and is considered good for all obligations which he incurs; and his constant aim is to so deal with his fellow-men as to merit their highest regard.

In stature, Mr. Jenkins is tall. His physical power and endurance are in keeping with his well-rounded character, and his features forcibly express the determination and grit which have marked his career thus far. He enjoys almost perfect health, and I am sure that the brotherhood will join with me in wishing him a continuance of that blessing, and success in all his undertakings.

J. FRANK PARKER.

Philadelphia, Pa., Oct. 21, 1899.

Friend P., there is something you have not touched upon, that I want to say about our friend Jenkins. When he was working for the railroad company he attended to his duties so well that he had considerable spare time from each day on his hands. When he wrote us about going into the supply business I asked him what his employers would say in regard to it. I was afraid

he intended to work this other industry in on the sly—that is, receive pay for working for them while he was really working a good part of the time for himself. Of course, I did not then know what kind of stuff he was made of. He replied at once that he had stated the whole matter to his employers, and they not only acquiesced but had promised to help him by giving him unusually low rates of freight to get his supplies. Later, when I saw some letters from the railroad men, proposing several times to give him even *more* than he had ventured to ask them, it taught me a good lesson; viz., that even great railroad companies have souls; and that, when they get hold of a young man who is open, honest, and square, without the least trace of a disposition in his heart to do things on the sly, they delight in honoring such a one, and showing him how much they trust him. All through our business deal with him I have been surprised and pleased to see that the railroad companies everywhere seemed to feel a pleasure in assisting him. My friend, are you sure that you have never been guilty of trying to keep back, evade, or elude the keen eyes of our railway corporations, say just a little bit? I am afraid that I have at times been guilty myself in just this line. Now, let us take a lesson from the experience of friend Jenkins. He is not a moneyed man, and never was; but he has another kind of riches that the great wide world has discovered, and that frank, manly, open face shows it. He loves his Savior, and he loves to be truthful.

APICULTURAL NOMENCLATURE.

CLAMPS OR CRATES; HONEY-BOARDS OR RACKS.

NOTICE two errors in Oct. 15th GLEANINGS, page 808, directly under the picture. You make me say, "So that the clamps for shipping-crates just fit." It should read, "*or* shipping-crates." Also 11th line below the picture, you make me say "*blankets*," when it should read *blocking*.

Now a word about crates and clamps, etc., noticed in your foot-notes. I believe I am correct when I call the *section-holder* a "clamp," for it is a clamp, as the sections are clamped in it, in all "clamps"—mine with a screw, others with wedges, and some with springs; hence a clamp is what we use to hold the sections in while on the hive, or, in other words, a clamp is used for holding a certain number of sections in and about the apiary, while a crate or case is used only for marketing honey. They are not used as a "clamp" about the apiary; so then we have "clamps" for use in the apiary, and "crates" for shipping and marketing honey only.

Again, we have *honey-boards* for covering the brood-chamber. We also have the Heddon break-joint *honey-rack*, not *honey-board*, for it is not a board; it is a rack, made of cleats—or slats.

We also have the perforated zinc queen-excluders. They are not "boards," but perforated sheets of zinc; hence they should be called zinc excluders. We also have the wood-zinc excluders, which are not *boards*, but wood-zinc excluders.

I suppose, properly speaking, we do not now use "honey-boards." I suppose formerly a honey-

board meant a perforated board placed over the brood-nest, upon which honey-boxes were placed, and the bees passed up through the holes in the honey-board into the boxes; hence the name "honey-board." Therefore what I now call a "honey-board" is really a brood-box cover.

Bristol, Vt., Oct. 28, 1889.

A. E. MANUM.

FAIRS, CONVENTIONS, ETC.

ARE BEE-KEEPERS WORKING AGAINST THEIR OWN INTERESTS WHEN THEY ATTEND THEM?

AT the late Illinois State Fair I had on exhibition extracted honey. I said to my competitor, "What makes the difference in this extracted honey—all white clover?"

He said, "I thought there was some trick about it."

I said, "I agree with Amateur Expert with reference to using white comb for light honey, although I believe A. I. Root differs. That honey there on exhibition was extracted from white comb, a good deal of it being built this year, and I had to use the most exceeding care to prevent its being broken. On very hot days it broke badly; but on cool days it did not. If I came across a patch of honey of different color, it was set aside, and not mixed with the very white. Have I a mistaken idea, or not, that, in order to have very light honey, it must be stored in white comb?"

FAIRS.

I stood by the honey and bee exhibit for three days; shook hands, and gave out sample copies of bee literature; and was I not working against my own interest? To be sure, we had a grand admiration meeting; but these advertising paraphernalia fell into the hands of those who own a few bees, and they may become subscribers, and learn how to produce more honey than they now do, bring it to this market, and undersell me. It appears to me as though bee-keepers who work at fairs are injuring themselves, but benefiting publishers and supply-dealers.

CONVENTIONS.

When I came home from Chicago the "lord of the manor" said, "What new ideas did you get at Chicago—learn any thing that you didn't know before? Keep bees just as well if you never went to a convention."

"Well," I said, "if I didn't learn any thing new, I saw something that I never saw before, and that was wooden comb that the bees had reared brood in for two seasons. Mr. Aspinwall claims that it will prevent swarming, as the bees can not rear drones. I should not think that the ladies would be as happy and contented, and work as well, when there are no gentlemen of leisure around—would you?"

It's funny, isn't it? that those who never attend conventions know so much about them. Now, there is Mrs. Chaddock, who never attended a bee-convention in her life, and how glibly she can tell what we all go for! We have an ax that I must own is very dull, as it is used only to pound up coal; but wouldn't I be very silly to carry it to a bee-convention to have it sharpened?

Mr. Root, you used to throw a wet blanket on conventions back in the seventies, didn't you? And even now, while there is one in session, a lily

that has a leaf as big as a cart-wheel has greater attractions.

There are so many changes in a year, would it not be well to have the international subject to the call of a committee, as to time and place? During the encampment of the G. A. R. I could have gone to Columbus and return for less than five dollars; but when the bee-convention met it cost twenty. I have been considering for the past year whether I had better go to Brantford, Ont. The fare will be nearly forty dollars, besides hotel bill, and honey is cheap, and bees slow of sale. MRS. L. HARRISON.

Peoria, Ill.

My dear friend, I believe that I did, a good many years ago, try to throw wet blankets on conventions, fairs, etc.; and it is equally true that I once tried, in a feeble way, to find fault with churches and Sunday-schools. May God forgive me for both. I suppose it is true, that once in a great while we cut off a little of our income by communicating to the outside world what we have learned in our special fields of industry; but, dear Mrs. H., do you not think the injunction from our Master, "Give, and it shall be given unto you," applies here? I know the question has come up a good many times, during late years. Shall we teach everybody every thing we know, or shall we keep our business, especially the new developments of our industry, to ourselves? The latter would seem to be the more prudent way; but I believe the experience of the world contradicts it. The man who gives most freely, by some strange law of our being gets most freely, as in the language of our text. We have found records of great business men who have given astonishing sums toward civilizing and Christianizing foreign lands. Did they become impoverished? Not so. The beginning of a liberal, broad, generous regard for their fellow-men away off in the distant parts of the earth was the beginning of their prosperity; and I believe, my friend, you will find it true that this habit of going to fairs, and working in a judicious and sensible way for the education of our people, will bring prosperity. Now, I am a little peculiar in this matter. I do not believe in keeping a single thing secret that would be of value to my fellow-men; neither do I believe in duties on foreign products—that is, so far as I have light on this subject. When those great big cabbages came from Holland, and sold at a big price in America, I felt happy because the neighbors in Holland had found a new opening for their produce, and a new encouragement to raise big cabbages. There has been some talk about putting a tax on bananas, and it pains me when I hear it discussed. I do not know what sort of people raise bananas, and I don't care. They are fellow-beings, and the large consumption opening up on them must encourage them in their special industry. I wonder if any of the readers of "GLEANINGS" live where bananas grow. If so, will they tell us something about it? Now, I do not know what bearing this has on politics. I am afraid I do not like politics very much; but I am trying to love my neighbors in Holland, in Jamaica, and, in short, in Europe, Asia,

and Africa, as I love myself. If the strawberries I raise have to be sold low because two great bananas can be bought for a nickel, what is my loss will be their gain; and I hope I feel as happy in feeling that their bananas are moving off rapidly (so they can be busy and happy in raising more)—yes, *happier*, than if I got 15 or 20 cents a quart for my great big strawberries.—Yes, I did go to see those lilies with leaves as big as a small cart-wheel, right during convention time. Mrs. Root has just one brother in this world, and that brother has just one daughter. I have heard more or less about her for twenty years or more, but I never saw her till the first day of the Chicago convention. She was an utter stranger in a strange land—had never seen the great city at all, and had never had a glimpse of Lake Michigan, nor of any other lake, until I went out to Lincoln Park with her. She was to take the evening train home, and so there was almost no way but to take a little time from the convention. I am quite certain that I lost a good deal by being absent; but I do not believe that the rest of you lost very much—especially when you had so many bright stars in the apicultural world who were also good talkers. I know it costs money to go to conventions. It frightens me sometimes to think of it. But let us avoid the other extreme by being penurious. What did God give us goods and money for? First, to glorify his holy name; second, to use for the good of our neighbors and fellow-men.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

RAT-TAILED MAGGOTS.

Mr. H. G. Frame, Manchester, Ind., sends me a large fine two-winged fly which he finds about his hives. He asks me to write it up in GLEANINGS. The only thing of special interest in this insect is, that the larva, or maggot, is not only worm-like, in being without feet, but it is often called the rat-tailed maggot, as there is a long tail-like organ, which carries a spiracle at its end. This maggot lives in filthy water—water containing decaying organic matter—and so finds this tail useful in lifting its one breathing-mouth out of the water, to get pure air. The fly that lays the eggs in this filthy water is a plump, brownish-yellow insect, looking quite like a bee. These flies are generally seen about flowers, where they search for honey and pollen. Of course, their mimicry serves them well; for, as they resemble bees, birds are rarely tempted to catch them. In macerating the bones of animals, when we place them in water in barrels, we often get a large supply of these rat-tailed maggots, and see the flies about, laying their eggs.

Agricultural College, Mich.

A. J. COOK.

QUEEN AND DRONE IN COPULO, AS SEEN BY AN EYE-WITNESS.

In GLEANINGS for Oct. 1, page 774, Prof. Cook desires to know if any one has ever seen the drone and queen fall to the ground in copulo. In June, 1888, I was fortunate enough to witness a case of this kind. I was first attracted by a considerable

noise made by bees in quick motion; and on closer observation I discovered that they were drones. They would drop nearly to the ground, and then rise again, only to again descend. The queen and one drone dropped at my feet, falling to the ground before they became disconnected. After they had become separated, the queen remained on the ground a sufficient length of time for me to pick her up in my hand and examine her closely. She was a very nice Italian, and I could not resist trying the experiment of introducing her to a colony of mine that I wanted to supersede their queen. I did so with entire success, by caging her in over night.

We increased from 4 to 21 colonies this season. We had a fine rain to-day, which is the third this season, something out of the common for California. The hills and valleys are quite green.

The Ignatum seed I got of you last spring is making fine tomatoes. They are very fine-flavored, and contain a great deal of meat. Thanks for the seed.

Los Angeles, Cal., Oct. 20, 1889. J. W. TOWNS.

Thanks for the valuable item you furnish, friend T. It corroborates the statements that have already been made.

SHUTTING THE BEES IN THE HIVES TO KEEP THEM FROM FLYING OUT AND DYING IN THE SUN.

Mr. Henry Leck, a neighbor of mine, is quite a successful bee-keeper. I wish to give you his mode of wintering bees, and ask you and others what you think of it. He uses a telescope hive, with the Gallup frame. He leaves them all winter on the summer stand, without any protection whatever—not even a windbreak; and when it gets cold enough for snow to begin to fly briskly, he stops the entrance with wire cloth, so as to prevent the bees from taking a flight until the cloth is removed in the spring. What do you think of it?

C. L. COOK.

Glen Rock, Neb., Oct. 29, 1889.

Friend C., fastening bees in their hive with wire cloth while they remain on their summer stands might answer in Nebraska, but it surely would not do here. We have days almost every week in the winter time when the bees would crawl around the entrance so as to injure themselves, and perhaps smother the colony. So long as the weather keeps down to the freezing-point, or pretty near it, the wire cloth, without doubt, will do no harm. Perhaps if a two-inch space were provided above the entrance, where the dead bees could fall out of the way, it might work better; but I do not think I would advise fastening bees in their hives when wintered outdoors.

THE APIARIAN EXHIBIT AT THE WORLD'S EXPOSITION FOR 1892.

Friend Root:—Until last Saturday I did not know that you had said anything in GLEANINGS about my taking charge of the apiarian exhibit at the World's Exposition in 1892, and I should not have known it yet had not Prof. Cook written to me, "seconding" what you said in regard to it on page 743. Many thanks for your kindly mention of me, and I'm sure I appreciate your good opinion. I was from home so much at the fairs, etc., that the bee-journals were slighted for several weeks.

I have thought a good deal in regard to the fizzle of the apiarian exhibit from the U. S., at Paris, and had come to the conclusion in my own mind that we *must* make the grandest display, or exhibit, of

the bee industry at the World's Exposition in this country in 1892 (wherever it may be held), that was ever made in the world; and to do this we must begin in time. With that in mind, and thinking that, as president of our national association, I might properly be considered the representative of American bee-keepers, I wrote those in charge of the proposed exposition in Chicago, and also to the mayor of New York, suggesting that, when the proper time arrives for arranging matters, we be given the proper inducements and space to make such an exhibit as will be a credit to us and an honor to the country.

The president of the Chicago organization replied, saying, "The suggestion you make is a good one, and will be laid before the proper authority for such action as may be required, should the fair be located, as we expect, in Chicago."

I have not yet heard from New York, and shall write to Washington as soon as I learn the name of some one engaged in trying to get the exposition located there, so as to be on hand at whichever place it may be located.

I expect to say something about it in the president's annual address at the convention at Brantford. It may, to some, seem a little early to "set the ball rolling;" but if we wait till next year we may be too late; for just as soon as congress settles the matter of location, the plan of the exposition will at once be laid out; and unless we are on hand we shall get left out.

A. B. MASON.

Auburndale, O., Oct. 25, 1889.

THE HONEY MARKET IN SAN DIEGO, CAL.

Our hives are heavy; 1000 swarms of bees were burned up in one place, and several other apiaries burned. This has been a poor honey year—probably about one-third to one-half a good year's return. Honey brings, extracted, 5 to 6 cts.; comb, 6 to 7; in Root's sections, about 1 ct. more.

J. I. FOOT.

San Diego, Cal., Oct. 10, 1889.

Friend F., we are very sorry to hear about the apiaries being burned. During your long drouth I should think there would be great danger of fires. I am astonished to hear that comb honey is down as low as you say. Just one year ago I priced honey in different stores in San Diego, and they wanted about twice what you mention, at retail. Do your dealers pay 6 or 7 cts., and retail for about 15 or 18? I know a good many excuse themselves in San Diego by saying that their rents are so excessive they are obliged to have high prices. Somebody had better run a honey-wagon around San Diego and suburbs.

AUGUST HONEY CANDYING IN OCTOBER; IS CANDIED HONEY IN COMBS FIT FOR A WINTER FOOD?

Friend Root:—Did you ever know of honey, gathered during the last half of August, candying in the sealed combs by the middle of October? This has been my experience this season. At my home apiary I usually take my fall crop of honey all off, and feed my bees for winter before I begin to extract. Great was my amazement, when I began to extract a few days ago, to find the honey in my best combs candied so that I could not throw it out. I reckon that I shall have half a ton of nice buckwheat honey for the bees to peck out of the combs next spring. In an experience of ten years I have never known honey, to candy before I had a chance

to extract it. I suppose the honey left in the hives will be in the same condition. Is candied honey objectionable for winter stores?

Hudson, N. Y., Oct. 21, 1889.

JAS. MCNEILL.

Yes, friend M., we have known honey to candy in just the way you describe. We supposed, however, that it was on account of the weed or plant from which it was gathered. We never knew buckwheat to do such a trick as this. Where honey candies in the comb it is a pretty hard matter to get it out. I would use it for feeding nuclei in the fall, where they are raising queens. They will use it all up, and it is not very apt to start robbing.

PUTTING WEAK COLONIES ON TOP OF STRONG ONES FOR BETTER WINTERING.

I have 46 colonies, some weak, all in square hives except four. I am going to set the weak ones on top of strong ones. I have a hole in the top of the strong hives. I think the heat from strong hives will help keep the weak ones warm. What do you think of the idea?

S. S. BUCKMASTER.

Moulton, Ia., Oct. 10, 1889.

Friend B., you do not say whether you propose putting bees in the cellar, or leaving them outdoors. In the former case there is no question but that it would be an advantage to the weak one. If outdoors, however, I do not think it would amount to very much unless you had a very large opening in the top of the strong colony, and this opening covered with wire cloth.

UNFINISHED SECTIONS BUILT OVER, JUST AS GOOD.

I began the season with 100 swarms, and now have 158. I have taken 3600 pounds of comb honey, and 700 extracted. The extracted all came from unfinished sections. I always extract all the unfinished sections, and put them away for spring use. I can not see but that they look just as nice as those made from new foundation. I use full sheets of foundation in the sections, and also in the brood-frames. I use the wire-imbedder, and a small tool for fastening the foundation to the top-bar, made by John Vandervort. I think the wire-imbedder a great deal better than the one advertised in your price list. I have used the Vandervort foundation-mill for about seven years, making all my own foundation, and supplying a number of other bee-keepers in this county. It has been a rather poor honey season for this section, being cold and wet most of the time.

S. A. BRIGHAM.

East Smithfield, Pa., Oct. 27, 1889.

We are glad to know that you have succeeded with sections of the year previous, friend B.; but we want to know more about that wire-imbedder that you say is ahead of ours. Can't you send us one by mail? We will pay you for all your trouble.

HOW TO REMOVE PROPOLIS FROM RUBBER GLOVES.

Some one wishes to know what will take propolis off from rubber gloves. Now, I do not use gloves of any kind, but have found by experience that a soap widely advertised as sapollo will dissolve and remove propolis from the hands, rubber belting, and any thing else that it happens to come in contact with. It will not injure the most delicate fabrics, or the skin either. I may say, in passing, that I am not interested in the sale of soap in any way.

Musson, La., Oct. 21, 1889.

DR. A. W. TUFTS.

THE BEE-BUSINESS BOTH PLEASANT AND PROFIT- ABLE.

Inclosed please find a check for \$1.00, in payment for GLEANINGS, which has been worth more than five times that amount during the past season. The timely hints were at once put into practical use, and proved of great value. I have been five years in the bee-business, and have now 68 colonies. I received about 1400 lbs. of white honey, from 47 colonies, spring count. I use the chaff and Simplicity hives, with T supers. I find the business both pleasant and profitable.

W. S. GARDNER.

Brown Hollow, Pa., Oct. 21, 1889.

A CORRECTION.

GLEANINGS for Nov. 1, containing my article on "Aphidæ," is just at hand. In the second paragraph I notice that one statement I did not make as I intended. What I wished and intended to say was this: "I always had the idea that they (insects) all come from eggs deposited in or on some substance, until within the last year or two, when my own personal observation forced me to come to the conclusion that there must be some exceptions to the rule." The italicized words were left out of the article in question. In Prof. Cook's article on flies I had understood him to imply the same idea.

Ipava, Ill., Nov. 5, 1889.

ANNA B. QUILLIN.

JAPANESE AND SILVERHULL BUCKWHEAT SIDE BY SIDE IN THE SAME FIELD; THE JAPANESE 100 PER CENT BETTER.

The peck of buckwheat you sent me did well. I got eight bushels from it. I sowed it the 10th of June; and I think if I had sown it a little later it would have done better. I sowed, the same day I sowed it, some silverhull buckwheat by the side of it. The Japanese was much better than a hundred per cent better. I would not sow the silverhull if a man would give it to me, and give me the ground to sow it on besides.

J. P. MEYERS.

Fort Dodge, Ia., Oct. 20, 1889.

40 BUSHELS OF JAPANESE BUCKWHEAT FROM 1/2 BUSHEL OF SEED.

Seeing the report of Mr. C. J. Schafer, of Eddyville, Ia., on Japanese buckwheat, I decided to send in mine. I sowed of seed, got from you last spring, a half-bushel on one acre of ground, and had just 40 bushels. My mode of cultivation was as follows: The ground was in corn last season; was plowed about the 20th of June, and thoroughly harrowed. On the 5th of July it was harrowed well, and 200 lbs. of dissolved bone drilled, then on the 9th of July the buckwheat was sown broadcast and harrowed twice with spring-tooth harrow. It was cut with a reaper 10 weeks from the day it was sown. If it had not been so dry just when it was making the grain thick it would have been much better.

LOUIS STEPHENS.

Fayette City, Pa., Oct. 24, 1889.

Friend S., our experience about here is, that it pays exceedingly well to drill in either bone or phosphate, at the rate of about 200 lbs. to the acre. Sometimes the phosphate makes all the difference between a good crop and no crop at all.

BEE-STINGS A CURE FOR RHEUMATISM; VALUABLE AND POSITIVE TESTIMONY.

It may interest you to hear my experience with bee-stings as a remedy for rheumatism. Ever since the war I have been a confirmed sufferer with this dread complaint. I have been treated by Dr. Ham-

mond, of this city, and Dr. Agnew, of Philadelphia, besides other doctors of less reputation, and in no case did I derive any permanent relief. I tried Blair's gout pills, and for awhile I controlled the disease with these; but finally they lost their grip, and I got so bad that I lay in bed for weeks, suffering such torturing pain that my wife was obliged to prop the bed-clothes so they would not touch me; and Dr. Cassaart had to be called in night after night to give me hypodermic injections of morphine. Finally my attention was called to newspaper articles about the first of last January, and I made up my mind to try the bee-sting remedy. I consulted with Dr. Cassaart, and he secured 25 bees. He grasped one after the other with a pair of tweezers, and let one bee after another sting me where the inflammation and pain were the greatest, until I was stung 18 times. He stopped then, because the pain had shifted from my left foot to my right knee. The doctor decided then to stop and await results. This was about 11 o'clock in the forenoon. When he called, about 5 o'clock in the afternoon, the pain had actually subsided, and by next morning I was up and around, *cured entirely*. I could walk, and stamp my foot as hard as I liked, and I have not had a single twinge of rheumatism since; therefore I consider bee-venom a specific for rheumatism.

JOHN MAGRUDER.

Washington, D. C., Oct. 25, 1889.

Friend M., you give us the most astounding testimonial that has ever been received. Had not so long a time elapsed since the cure. I should be inclined to think it might be only temporary. The account reads some like a patent-medicine testimonial; and I hope you will excuse me for being uncharitable enough to fear that you were going to wind up with something to sell—perhaps bee-venom put up in bottles. It is not very likely, however, that this remedy will need to be administered in that way. Scarcely a locality can be found where there are not more or less bee-keepers; and any bee-keeper could give you 25 bees at any season of the year, without very much expense. Will other friends who are suffering from rheumatism test the matter and report? It seems to me that your doctor should take pains to have the result of this experiment widely disseminated through the medical journals. It may be a little offset to the talk there is in some localities about bee-keepers being a nuisance.

BEE-STINGS SEEMINGLY NOT A CURE FOR RHEUM- ATISM.

I am not in the habit of writing for publication, neither do I think myself capable; but as you ask for facts regarding bee-stings curing rheumatism, I will say I have had some experience in the matter, as I have been afflicted with that disease ever since the late war. In fact, I got it there. About 12 years ago I got my first swarm of bees; and, as you know, beginners usually get stings enough. Some time after, I began reading bee-literature more or less; and among other things, plenty of stings, it was said, would cure my disease, but time wore on. My rheumatism didn't hurt so bad, and I began to think I was cured; but, alas! I am to-day as bad as I ever was, and I believe worse. So I would say to all afflicted in that way, don't harbor such a vain delusion, for it is nothing less. As I said, I have had it since the late war, or for nearly the last 25

years, and am now 55 years of age, and expect to have to suffer as long as in this tabernacle.

Dugger, Ind., Oct. 23, 1889.

J. LAMMEY.

Why, friend L., if the stings were not a cure, you admit that it did not hurt so bad; and if the bee-stings were only an alleviation temporarily, I think that is something to be thankful for. Your case was a very aggravated one, if I understand you correctly.

OUR QUESTION-BOX.

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 148.—*a. If your colonies had their combs well filled and capped over with honey-dew, and you had no other combs to give them, would you, if sugar were high, extract it and feed granulated-sugar syrup? In other words, would you prefer to run the risk of their not wintering on honey-dew, rather than to go to the expense of extracting? b. If well-ripened buckwheat were substituted in place of the honey-dew, as in a, what would be your procedure?*

I never had any honey-dew till this year. I have concluded to let the bees take their chances in wintering on it, rather than go through the labor of extracting and feeding.

G. M. DOOLITTLE.

Under these rare conditions I would extract and feed something better. Bees winter well on good buckwheat honey and it could be fed instead of sugar. There is much called honey-dew that is something else.

P. H. ELWOOD.

Here in the South, bees winter on any kind of sweets they gather; but as honey-dew is detrimental to safe wintering in the North, it will pay better to extract it and feed granulated-sugar syrup than to run the risk of losing the bees.

P. L. VIALON.

a. I would extract, at least from the majority of my colonies. I might "chance" a few hives on honey-dew. b. Let them alone. Well-ripened buckwheat honey is good winter food for bees or men.

MRS. L. HARRISON.

I should trust the honey-dew to winter on if well ripened. *b. I would not disturb the buckwheat honey, if well ripened. It is of great importance that any honey can be well ripened for winter stores.*

H. R. BOARDMAN.

a. I would take my chances on their own stores killing them, rather than to extract, especially here, where full hives of bees can be bought for \$3.00 each, in hives worth \$1.25, and when sugar, as now, is worth 10 cts. per lb.

R. WILKIN.

I have run the risk successfully, many times, of having honey-dew or buckwheat honey for winter stores, and I will do it again every time. It is the damp above that kills your bees, but not the honey-dew nor buckwheat honey, nor the bee-bread.

C. F. MUTH.

a. Yes, I would. So far as I know about honey-dew, it is not safe, though my experience with it is very limited. Granulated sugar I know is safe, and a sure thing is always the best for me. b. I would have it, as I have wintered bees successfully on buckwheat honey alone.

A. E. MANUM.

a. We prefer to go to the expense of feeding sugar syrup, rather than to run the almost certain risk of losing our bees. b. We consider well-ripened buckwheat honey as safer than honey-dew; yet we prefer clover honey. It is on that account that we do not extract honey from brood-chamber in summer.

DADANT & SON.

a. I have had honey-dew that I should not consider it any risk to winter bees on; and I have seen that which I would know there was no risk to run in wintering bees on it, for they would surely all be dead before spring. b. I'd mind my own business (if I had any) and let the bees alone. If I hadn't any business, I'd proceed to find some.

A. B. MASON.

a. I have had too little experience with honey-dew, to answer this part of the question. b. Well-ripened buckwheat honey has given me the best satisfaction of any thing I have ever used for winter stores; and if I were to do any substituting at all, I should prefer to put such honey in place of sugar syrup.

O. O. POPPLETON.

That would depend. If the honey-dew were pleasant enough for my own table, I should not fear it. I have eaten honey-dew honey that was A No. 1. *b. If in the worker combs, give these combs to bees. If not, I would extract from sections, and feed. I see no trouble. Perhaps I misapprehend the question.*

A. J. COOK.

a. I should probably run the risk of wintering on honey-dew; but I would do this: Late in the fall I would give each colony 8 to 10 pounds of good sugar syrup. This would be stored where it would be first consumed by the bees, and would reduce the danger of loss to a minimum. b. I consider good buckwheat honey equal to white clover, for wintering bees.

GEO. GRIMM.

a. I certainly would feed them something—good honey or sugar. Pure honey-dew is death to bees in winter. I knew a man who experimented by feeding 20 colonies on honey-dew exclusively. He put them in a cellar, and all died. Other colonies, wintered in the same cellar, fed on good honey, came out all right. b. If they had well-ripened buckwheat, or any well-ripened honey from any kind of flowers, I should let them alone.

S. I. FREEBORN.

If the combs were filled with all honey-dew, no good honey in them, I should hate to risk them. I should say, extract a part of them, one-half, and feed sugar. Buckwheat and fall honey, gathered from actual flowers, is good for winter feed for bees, and is good on pancakes. Our bees have all some honey-dew, gathered after the basswood flow. We shall let it remain, as the bees have got a good supply besides, of basswood honey.

E. FRANCE.

a. I have had little experience, and I don't believe I would extract any sealed combs I have ever had, in order to replace with sugar syrup. I think, however, that in some places it is so bad that it might be best to extract the honey-dew. b. Put in the buckwheat in combs, if possible; but if extracted, be sure there is no foul brood about it, and then feed as early as possible in the Warner-Miller feeder.

C. C. MILLER.

a. I have had very little experience with honey-dew, and none in wintering bees. All honey-dew is not alike. If it were like some I have seen, I think

I would risk it, though to be on the safe side I might try half my bees each way. b. I am not familiar with buckwheat honey. We get very little of it here. The honey gathered from heart's-ease, which is a near relative of buckwheat, is unsurpassed as a wintering food. I think I should prefer it to clover.
J. A. GREEN.

The above is a question that is now agitating the mind of every bee-keeper in the Eastern States; and the honey-dew is of such a consistency that it can not be extracted. Those who have no extra combs have no alternative but to let them winter on these stores. Even with extra combs we do not learn of a bee-keeper who is feeding sugar syrup. The cost of sugar, time, and trouble, we think, will equal the value of the bees. The Rambler believes it will be cheaper to buy bees by the pound in the spring to supply the deficiencies. We are happy to say, that nearly all of our colonies have extra-nice clover and basswood honey to winter on. When extracting we save a case of honey for each colony for just such emergencies. b. If we had well-ripened buckwheat honey, we would certainly exchange the honey-dew for it, and feel no uneasiness about the wintering problem. So far as our observation goes, buckwheat honey is an excellent wintering food.
RAMBLER.

I can readily imagine, that, in a different apiary and field, the proper course of procedure might be different from that which is best here. With me it is a case of boy vs. woodchuck. Bees must winter on their own stores, else their keeper must go out of the business. In a field with an ocean of flowers, and comparatively little honey in them, it is necessary to keep a large number of colonies; and the expense of stocking them all up for winter with granulated sugar is too great to be borne. Keeping 100 colonies, and expecting to take 20 lbs. apiece from them, is a very different affair from keeping 40 colonies and expecting to take 100 lbs. apiece from them. I do not know that buckwheat is more unsafe for winter than other late honey, but I suspect it a little. I think honey-dew varies greatly as to its wholesomeness. If the stores are known to be bad, double up the colonies the stronger in the fall, so that they can keep warm without eating so much of the stuff.
E. E. HASTY.

Dr. Southard, of Kalamazoo, who, by the way, is one of the brightest and most expert bee-keepers of the day, as well as a physician and somewhat of a chemist, held views like my own regarding honey-dew; and several years ago, when everybody's bees all over the country gathered so much honey-dew, and were all going to perdition with it in the winter, the doctor thought he would like to know something positive about it; so he saw to it that five or eight colonies, I forget which, had nothing but honey-dew. He winters outdoors, and usually loses but one or two out of a hundred, and, sure enough, the five colonies having honey-dew exclusively, wintered as nice as a pin. I think I have demonstrated that dysentery among bees, the one and only worthy cause of winter losses, is not caused by honey-dew nor cider, nor any thing of the kind, but by the consumption of nitrogen from bee-bread or floating pollen. Well-ripened buckwheat is as good stores for winter as any in the world, in my opinion, and I am answering this question from long experience and observation. Your bees may die on the stores they have, or on

any other, except pure granulated sugar syrup in combs containing no pollen, and the bees placed in a warm repository. Then they never die.

JAMES HEDDON.

Only two of the above decide positively in favor of extracting the honey-dew, and replacing it with stores of sugar syrup—Dadant & Son, and Freeborn. Very likely there are circumstances where it would be prudent to throw out the honey-dew, but if it were well ripened and sealed up in the combs, I should be very loth to do so. Some years ago a neighbor of ours had the very worst kind of spring dwindling. The stores seemed to be frothy, dark-colored, and bad-tasting, and he felt satisfied it was the sort of food that killed them. I believe he saved only a few colonies out of an apiary of over 100 colonies. By my advice, however, he took some of the combs from the hives where the bees had died, and prepared several colonies the next winter, to go into winter quarters on these objectionable stores. They had almost no other. Did it kill them? No. To my great surprise, and his also, the colonies so treated wintered nicely.

NOTES AND QUERIES.

We solicit for this department short items and questions of a practical nature; but all QUESTIONS, if accompanied by other matter, must be put upon a SEPARATE slip of paper with name and address.

THE 1892 CENTENNIAL.

I wish to second your suggestion for the appointment of our good friend Dr. Mason for the '92 centennial. He is just the man. A. J. COOK.
Agricultural College, Mich., Oct. 10, 1889.

QUEENS AND DRONES IN COPULO.

Yes, some one about 18 years since related in the *American Bee Journal* that something struck on the rim of his hat and fell on the ground immediately before him. On looking closer he discovered that it was a queen and drone in the act of copulation.
Ventura, Cal. R. WILKIN.

THE SIZE OF THE JAPANESE BUCKWHEAT GRAINS.

I have some of the Japanese buckwheat; and, as I expected, I can not clean it with my mill. The grains are too large. F. A. SNELL.

Milledgeville, Ill., Sept. 26, 1889.

[Well, friend S., you have given us a positive proof of the extra size of the Japanese buckwheat that had not occurred to me before. I presume you can get an extra sieve, either of wire cloth, or, perhaps better still, perforated zinc, to match the Japanese grain. If others have had like difficulty, we will try to look up something specially suitable for the buckwheat.]

BEES NEAR SALT WATER.

Some years ago I saw an article in GLEANINGS, saying that bees near salt water would make salt honey, or honey that is worthless. That is a pure fabrication, or worse. I have 50 colonies in a salt marsh, and the bees do just as good work as those I have two miles from salt water, and there is no difference in the quality of the honey.

JOHN FARNSWORTH.

Honolulu, Sandwich Islands, Sept. 26, 1889.

[Friend F., we have had several communications to the same effect.]

WHEN IS IT NECESSARY TO WARM BEE-FEED?

I have a quantity of strained honey. Will it need heating, or any thing done to it before feeding?

W. STICKNEY.

Rathboneville, N. Y., Oct. 22, 1889.

[It is not necessary to heat honey for feeding purposes, unless you suspect that it *might* contain the germs of foul brood. If the honey is of your own production, and you have never had foul brood, feed without heating. In "feeding back" to fill out sections, the honey, after being diluted with water, is warmed if the weather is cool, to get the bees to take the food more readily. In feeding syrup late in the fall, we prefer to have it warm, or to feed it shortly after leaving the stove.]

REPORTS ENCOURAGING.

FROM 31 TO 50, AND 7016 LBS. OF HONEY.

I started in the spring with 24; bought 7 young swarms; increased to 50, and got 7016 lbs of honey, about half comb and half extracted. The white clover promises good for next year.

Raymore, Mo., Oct. 22, 1889.

W. O. HEIVLY.

CAPS THE CLIMAX.

As you want reports, this is mine. It caps the climax around here: 100 lbs. comb, 20 lbs. extracted, per colony, spring count; 24 in spring, 50 now.

Wagstaff, Kan., Sept. 28, 1889.

C. S. NEVINS.

FROM 6 TO 14, AND 600 LBS. OF HONEY.

My honey report is, that, with 6 swarms, spring count, I increased to 14 (all in good condition for winter), and took 600 lbs. of comb honey; 2 swarms gave me 300 lbs. by tiering up on Dr. Miller's plan.

Columbus, Wis., Oct. 7, 1889.

R. B. KIDDER.

FROM 3 TO 10, AND 350 LBS. OF COMB HONEY.

We have had a good year for honey here in Colorado, and all bee-keepers seem well pleased with their crop. I began last spring with three; since have increased (after transferring from box hives to frames) to ten, and have taken 350 lbs. of comb honey in one-pound sections, and have all in a fair shape to winter.

E. D. NICHOLS.

Montrose, Colo., Oct. 20, 1889.

FROM 34 TO 56, AND 2850 LBS. OF COMB HONEY.

We have had a fine honey season here, and honey is very plentiful and cheap; in fact, the market is overstocked. We can get only 10 cts. per pound for nice comb honey, in cash, and that only for small quantities. I have taken 2850 lbs. of comb and extracted, from 34 colonies, spring count, and increased to 56 good colonies with a great abundance of stores for winter. I finished packing 50 colonies in chaff the 10th of October, and will put 6 colonies in cellar.

GREEN R. SHIRER.

Greene, Ia., Oct. 18, 1889.

A GOOD REPORT FOR THREE SUCCESSIVE SEASONS;
ALFALFA IN ARIZONA.

I have been keeping bees here for three years. In 1887 I commenced with 34 colonies, and increased them to 51. I took 6358 lbs. of extracted and 300 lbs. of comb honey. In 1888 I commenced with 51 colonies; increased to 84; took 8600 lbs. of extracted and 600 lbs. of comb honey; lost three during the winter. Last spring I doubled back from 81 to 70; then I increased to 90, and took 12,948 lbs. of extracted honey. About 9000 lbs. was obtained from alfalfa.

J. A. CULBERTSON.

Phoenix, Ariz., Nov. 2, 1889.

GOOD FOR OREGON.

B. F. Kendall started last spring with two colonies, and now has seven. He took 600 lbs. of comb honey. No record I have seen can beat it. J. L. Cole started with 4, and has 15 now. He took 1000 lbs. of comb honey. This large yield is from sweet clover and alfalfa. By a process of irrigation we have had a continual flow up to the present, four crops of hay being cut from the alfalfa fields.

G. J. GRAY.

Dell, Ore., Oct. 12, 1889.

We are very much obliged for still another testimonial in favor of alfalfa grown by irrigation. See friend Ball's report on another page.

HOW AN INVESTMENT IN BEES OF \$145 BROUGHT
\$218 IN MONEY, BESIDES ALL THE FIX-
TURES FOR A SMALL APIARY.

I had 3 swarms in the spring. I bought 40 frames of brood and 20 queens, June 15. I put 2 frames of brood and a queen in a hive, making 20 hives. I let them build up, and made two swarms by natural swarming, making 25 in all. I took 2130 lbs. of extracted honey, and 50 lbs. of comb honey, making in all 2180 lbs., besides leaving from five to six sealed frames in a hive to winter on. I have invested \$145.02 in bees and fixtures this year, and in return I got \$218 worth of honey, besides 25 good strong swarms of bees, and all the fixtures; and at the same time I never lost a day, as I have charge of a mill and can not get away; and I never paid a dollar for hired help. Thus you see it leaves me \$73.00 for interest on money invested, besides all my bees and fixtures.

JAS. MCCUE.

Alabaster, Mich., Oct. 20, 1889.

Friend M., your experience is wonderful, and, I must think, quite unusual. It shows, however, what may be done by one who is full of enthusiasm during a favorable season.

FROM 84 TO 200, AND 6500 LBS. OF COMB HONEY.

We started off last spring with 84 colonies of bees—some blacks, some Italians, but mostly hybrids. The early spring was very favorable. This gave the bees a good start in the way of brood, but cold nights and cold rains kept them almost idle. When white clover blossomed they were very numerous, and the way they piled up honey and sent out young swarms was a caution. We sent for supplies, money with the order, and part of it was filled after the swarming and honey season was over, and we were out at least 2000 lbs. of comb honey, and 25 large colonies of bees. We were not prepared to extract, as we have been running entirely for comb honey. However, they continued to build some at intervals up to the 18th of September, when a severe frost ended their business in the surplus boxes. On counting up at the close, we find we have 6500 lbs. of comb honey, mostly in 1-lb. sections, and increased from 84 to 200 swarms.

Big Rock, Ia., Oct. 20, 1889. GEO. W. RANDALL.

Friend R., I hope it was not *our* establishment that made you wait until the honey season was over. But may be it was, if you were late in getting the order off. Here, friends, is a good illustration of the losses that come when you wait until the very last thing before you order your supplies. Better carry them over one season, or at least a part of them, than to be caught as friend R. was.

Every boy or girl, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock six different books, as follows: viz.: *Sheer Off, Silver Keys, The Giant-Killer*; or, *The Roby Family, Rescued from Egypt, Pilgrim's Progress, and Ten Nights in a Bar-Room*. We have also *Our Homes, Part I., and Our Homes, Part II.* Besides the above books, you may have a photograph of our old house apiary, and a photograph of our own apiary, both taken a great many years ago. In the former is a picture of Novice, Blue Eyes, and Caddy, and a glimpse of Ernest. We have also some pretty little colored pictures of birds, fruits, flowers, etc., suitable for framing. You can have your choice of any one of the above pictures or books for every letter that gives us some valuable piece of information.

UNCLE AMOS TELLS ABOUT A VISIT TO A POWDER-MILL.

PERHAPS the little friends will be somewhat surprised to know that Uncle Amos should take pains to visit a powder-mill, and to tell how powder is made; and, to tell the truth, I do not believe very much in gunpowder. There are, however, places where gunpowder is needed. Last evening at our teachers' meeting, one of our German teachers said that, in the old country, they used to have great high walls around their towns and villages, as a means of protection. These walls were built a great many years ago, but many of them are still standing. He said that, after the invention of gunpowder, they did not need walls, and so they were allowed to run down. Well, dear little friends, in our United States of America it begins to look as if we did not need stone walls nor gunpowder either. In our own town the fences are disappearing, and the pistols and bowie-knives are disappearing also; but for all that, our strawberries and Bartlett pears are safer than they have ever been before. How does it come about? Why, I think it comes as the result of the work of our Sunday-schools, Christian Endeavor societies, and young people's prayer-meetings. It is a good deal cheaper to buy these things at the fruit-stands than to steal them nights and then carry a guilty conscience around with you all the next day. I suppose, however, our policemen and officers of the law will need gunpowder for quite a spell yet. It is also used to a considerable extent to blast rocks, blow up stumps, etc. Gunpowder is many times a very good servant; but people who get mad very easily ought never to be trusted with it.

Among other pleasant recollections of my visit to friend France is that of a visit to one of the largest establishments, probably, in the country, for the manufacture of powder. The plant occupies perhaps 100 acres in a lonely valley at the foot of a great hill. I say "lonely," for nobody wants to live within at least half a mile of the powder-

works. Before we came to the factories we saw the magazines, or storehouses, scattered here and there out in the fields. They endeavor to have them far enough away so that, if one blows up, it will not ignite the others. Since powder has been stored in tin cans instead of in wooden kegs, however, I believe the danger of blowing up the magazine is much less. Now, instead of one great factory there are only solitary buildings scattered through this hundred acres. As a rule, each workman has his own building. This is thus arranged, in order that no workman may lose his life through the carelessness of others. If he is "boss and all the hands," he can have every thing just as he wants it; and if he blows himself up he alone is to blame. White poplar or willow is used for making charcoal for powder. The material would make very nice sections for honey. I believe it is grown purposely in the vicinity for the powder-men. It is burned into charcoal a good deal as they make charcoal for other purposes, only they have nicer kilns, and they take more pains. The other ingredient, saltpeter, is brought from South America, in bags. It is dried and pulverized on the grounds. The third ingredient, sulphur, is, I believe, nearly ready for the powder as it is purchased. No railroad runs nearer than several miles, so the materials have to be brought in, and the powder carried away on wagons. Very likely they would not want a locomotive much nearer than half a mile, any way. A great part of the works is moved by water-wheels, although they have one very nice steam-engine. The power is, however, carried by long tumbling-rods or wire rope, to the mills. Steam for drying the ingredients and the powder is also carried a long distance. After the materials are pulverized separately they are mixed together and still further pulverized in large revolving cylinders containing copper balls. When I asked some questions about the balls, the lonely operator stopped one of the barrels, reached his hand in, and gave me a couple of the balls to carry home. They are about as large as hickory-nuts. They have to be made of copper, so they will not strike fire. There are a series of mills used for making powder into grains. After it is ground to an impalpable powder it is pressed into cakes by a powerful hydraulic press. This press is moved by a water-wheel. This wheel starts and stops itself. When the buckets get all full of water, it starts up and turns an enormous screw until it makes every thing squeak. Then it rests a while, apparently, and starts up again, and gives the powder cake another awful squeeze, and so on. Each time it seems to squeeze it down a little more solid. In the caking-mill fine powder is kicking around the floor, perhaps half an inch deep. The dust has settled on the beams and rafters until they are as black as ink; and if you touch any thing anywhere, you are sooty black. The operator looks like a veritable black man. When they get through work they slip off all their clothing, and take a bath. Most of the hands, I believe, work by the piece, so

they can start and stop when they like. The water-mills are always ready to run. If they do not use it, the water runs away, so it does not make any difference when they start or when they stop. The coarse grains of blasting-powder, almost as large as kernels of corn, look very handsome. The grains of powder are polished with something very much like stove-black, and they shine just like a nicely polished stove. I do not know whether the shine is to make the grains look handsome, or whether the powder goes off better when it is shiny, and pretty to look at. In the drying-room, where the grains are thoroughly dried, it was so hot I could hardly endure it, even for a few minutes at a time. I asked the attendant how many degrees it would have to be to go off, and send us all into eternity. It did not require very many degrees, but he assured me their machinery was so precise that it could not, by any blunder, run up to the exploding-point. Explosions do occur every little while, so friend France states, and the people in the vicinity have become accustomed to hearing them. If it is one of the mills where the powder is in the finished state, it goes off like a cannon; but if it is the powder before it has been made into grains, the report is somewhat drawn out like a slow clap of thunder. Some years ago one of the men who had charge of the mills forgot something, and went back after dark with a lantern. He knew better, but he thought he would be very careful. Something happened, and the powder got afire. This fine powder burned so slowly, however, that he had time to jump into the race and dive until the explosion was over. Then he put up his head and got out comparatively unharmed. Had he not had his wits about him, he would surely have been horribly burned to death.

Visitors are permitted to go anywhere they wish, but they must not smoke cigars, nor carry firearms. If a man comes on the premises with a gun in his hand, he is led off by the collar. Some years ago a young dude by some means slipped on to the grounds unobserved, with a lighted cigar in his mouth, and, before anybody knew it, he marched into one of the powder-mills, and asked to see the foreman. The men in charge instantly replied, "He is right here by the door," and led the way. As soon as they got him outside they took him by the collar and dragged him off to a safe distance, and then gave him such a shaking and talking to as he will probably remember as long as he lives; and he will probably not go into a powder-mill again with a lighted cigar. My friend, if I were you I would not go into *any* kind of a mill with a cigar. No, I would not even go into any building with one; and, come to think about it, I would not go anywhere else with one. If you expect to go to heaven you may be sure you will have to throw away your cigar a long while before you get there. O boys, I wish you would throw the cigars away now, before you get any further along in the journey of life. Please do it, out of respect to Uncle Amos, even if for no other

reason; or, better still, throw it away now for the sake of Christ Jesus.

CLOVER-BLOAT.

My father uses a wisp of hay twisted, and puts it in the animal's mouth and ties it around the horns.
Carlton, Pa., Aug. 24, 1889. HUGH HOGUE.

BOBBIE AND NELLIE.

We have 50 colonies of bees. We take GLEANINGS, and I suppose we always shall. I have two pigeons for my pets. I call them Bobbie and Nellie.
Winnie Naylor, age 13.
Lockharts, W. Va., Aug. 16, 1889.

BEE-STINGS FOR RHEUMATISM.

Some time ago a doctor discovered that stings would cure rheumatism. He tried it on a patient, and found it to work satisfactorily. Now he has a colony of bees, and has cured a number of patients, and has inflicted over 3000 stings.

I. E. HINDMAN, age 14.

Colora, Md., Aug. 23, 1889.

A good deal has been said lately concerning the value of bee-stings as a cure for rheumatism; but it seems to us your doctor must have found out a new way of inflicting stings to do it in such a wholesale way. *Three thousand stings!* Whew! How does he do it? He must have an improvement on the bees' way. We wouldn't want to be doctored by that doctor.

A GOOD REPORT FOR CARNIOLANS.

Father has 75 swarms of bees. I help him take care of them. Sometimes I hive them alone when he is away. He has Italians, blacks, hybrids, and one Carniolan. He likes the Carniolans best, and so do I, because we have to use no smoke at any time. They make very white honey. Our Carniolan swarm was so light in the spring that we put it on four frames. It built up of itself, and made 61 one-pound boxes of very white honey, and swarmed once.

HENRY C. COX, age 11.

Monkton Ridge, Vt., Oct. 2, 1889.

BEEES, CATS, DOGS, ETC.

My Uncle Joseph has taken about 500 lbs. of comb and extracted honey, and has sold almost all of it. I have a little dog named Gypsy, and the bees think he is a little bear. He got stung last Saturday. We have four cats. The cats don't like the dog. One of our cats is very peaceful, and doesn't like to fight; and when he is asleep, Gypsy will come and sit on him.

MABEL BRIGGS.

Cornwall Landing, N. Y., Nov. 4, 1889.

THE IGNOTUM THE BEST TOMATO.

We raised three plants of Ignatum tomatoes. Papa set two of them by the side of the house, and trained them up. One of them covered a space four feet wide and eleven feet high. Everybody thinks they look very handsome, especially when they had those large, red, ripe tomatoes on. Papa thinks it is a very nice way to raise tomatoes, where you have a small garden. Next year he says he will train them all up by the side of the house. We think that the Ignatum is the best-tasting tomato we ever had. Papa takes GLEANINGS, and expects to keep bees again.

LULA K. RUGER.

Binghamton, N. Y., Oct. 14, 1889.

TOBACCO COLUMN.

CONDITIONS UNDER WHICH WE GIVE SMOKERS TO PERSONS WHO STOP USING TOBACCO.

First, the candidate must be one of those who have given up tobacco in consequence of what he has seen and read in this department. Second, he promises to pay for the smoker should he ever resume the use of tobacco in any form, after receiving the smoker. Third, he must be a subscriber to *GLEANINGS*. Any subscriber may, however, have smokers sent to neighbors or personal acquaintances whom he has labored with on the matter of tobacco-using, providing he give us his pledge that, if the one who receives the smoker ever uses tobacco again, he (the subscriber) will pay for the smoker. The one who receives the smoker in this case need not be a subscriber to *GLEANINGS*, though we greatly prefer that he be one, because we think he would be strengthened by reading the testimonials from time to time in regard to this matter. The full name and address of every one who makes the promise must be furnished for publication.

THE TOBACCO HABIT, AND ITS EFFECT UPON SCHOOL WORK.

The following is from the principal of the Iowa State Normal School. I have copied it from a little tract sent to me:

After making a study of several hundred boys, running through a period of ten years, I give only observed facts, and neither assume the conditions nor jump at foreordained conclusions.

1. Boys that begin the habit at an early age are stunted physically, and never arrive at normal bodily development.

2. Accompanied with the use of the narcotic were certain disordered physical functions, such as indigestion, impaired taste, defective eye-sight, dull hearing, nervous affections, and diseases of the heart. I have not found a single case of early addicting to the habit of tobacco-using that did not suffer with one or more of these direful abnormal conditions.

3. Tobacco, used in any form, destroyed the ability to apply one's self to study, and prevented his comprehending or remembering his lessons. The mental faculties of a boy under the influence of the narcotic seem to be in a stupor; and since depraved nerve power stultifies and weakens the will power, there is but little use for the teacher to seek to arouse the dormant, paralyzed energies, or to interest and foster the fagged desire. I have not met a pupil, that is addicted to the habit, who will go through a single day's work and have good lessons. I have never had one whose scholarship record was good, and in almost every case the deportment was below the average standard. At the regular examinations for promotion, nearly every one of the tobacco-using pupils fails in doing the most reasonable test work, even if this is not the first time the work has been passed over in class. I have had numbers of cases in which they have remained in the same grade for four successive years, and then they were not ready to be advanced into the next higher class.

Actual Cases.—1. A high-school boy, who had always done excellent work, was reported one term as not getting his lessons. I had a talk with the boy, and stated the facts, assuring him that with his past record his poor work was unexplainable, as he insisted that he devoted his time faithfully to his studies. He denied using tobacco at all. His work failed from month to month; and before the year closed, his parents withdrew him from school. His father deeply regretted the failure, admitted that a change had come in the boy's conduct at home, but as he had heretofore been truthful and faithful he could not think that the pre-supposed cause was the true one. In a few months the habit, thus far secret, became more pronounced and more public, and it was absolutely established by the boy's own admissions, that it was begun several months before the trouble noticed at school, and that no one knew it save the salesman that furnished him the supply of the narcotic.

2. Four years ago a boy entered one of my primary schools as a chart pupil. Before the boy was four years of age he had learned the habit of smoking cigarettes and stubs of cigars. His father taught him the use of narcotics, and considered it sport to see his son exhibit the habits and tastes of his elders. During the four years he did not complete the twenty-four lessons on the chart, although he attended regularly, and applied himself as diligently as the average pupil of that grade. He

seemed perfectly unable to learn like other children, though he was at the beginning a precocious, promising child. His mental activity was so dulled and paralyzed as to render him but little better than an idiot or imbecile. Experience has shown that the younger the habit is acquired, the more disastrous the results to the mentality of the child.

3. One boy was a successful primary pupil. His work and his interest were constantly praised by his teachers. On his entering the last half of the third grade, his work began to lag and his interest to decline. At the examination for promotion his case was conditioned, and it was detected that he had begun some months before to use tobacco. His parents were informed, and strenuous efforts were made by his teacher to get the habit restrained and corrected. His reform was not secured; and, though he remained five years in the same grade, he was never able to advance on merit, and several trial promotions proved failures.

In a case where reform was secured and the habit overcome, the pupil again returned to normal progress, and had a successful career as a student.

Other Observations.—So far as my observations have extended, not a single boy has passed the examination required for admission to the high school after he had acquired the habit, and not one has graduated from the high school who began the habit after beginning his course in that school.

But the moral results are also as serious. Pupils under the influence of the weed are constant subjects of discipline, are not truthful, practice deception, and can not be depended upon. A change in character in a formerly good boy is a very strong indication that some habit is getting hold upon him, whose tyranny must be broken before he will again be clothed in his right mind. The worst characteristic of the habit is a loss of personal self-respect, and of personal regard for the customs and wishes of ladies and gentlemen, especially when among strangers.

If these observations mean any thing, they declare that something ought to be done to save child-life from the pitfalls that commercial interests are digging, and that *greed* is encouraging; that more should be done than to instruct by oral or text lessons in school; that teachers, parents, and philanthropists are not yet sufficiently aroused regarding the magnitude of the evil of tobacco-using by children; that, in the crusade against alcohol, we should recognize that other evils, though more quietly, are just as surely sapping the strength and destroying the vigor of the youth of this generation.

I have read the above over very carefully, some parts of it several times, and I am forced to say that the facts given accord exactly with my own experience. I am president of our school board in Medina. I have talked with the boys in our schools, in regard to the use of tobacco. I have watched those who persist in using it, for years, and, awful as it is, it is no doubt true. My friends, are you setting as bad an example before your boys and your neighbors' boys? and, mothers, are you sure your boys are not using it secretly? Again and again have I been astonished and pained to learn that boys had been some time secretly using tobacco when their parents were members of churches, and did not in the least suspect such a thing. Such boys, however, soon drop away from the Sunday-school. The presence of good people is a reproach to them, because they feel guilty in their hearts—guilty of living a falsehood, even if nobody had ever asked them whether they used tobacco or not; and it seems to me that the worst kind of falsifying in this world is telling a falsehood by actions—telling an untruth to everybody whom you meet, in trying to have them suppose you are a clean, pure-minded boy. Every boy tells such a falsehood when he puts his cigarette out of sight when he sees some-

body coming. Can any boy be real happy, and have any real fun, so long as he is *living* a falsehood every day of his life?

TOBACCO IN THE HOME.

The following, evidently from the New York *Graphic*, has been sent us. Whatever its source, we are glad to give it insertion in this department. It is what a mother says of tobacco. It reads as follows:

"My little girl," said a pretty young mother to a New York *Graphic* writer the other day, "has been nearly killed by her father's smoking. You see, when I married I determined to be very liberal and advanced, and to do what I could to make home as attractive to Tom as his club. Mother would never allow smoking in her house, except in the smoking-room; but I made sage reflections upon the tactlessness of women in managing men, and determined that Tom should enjoy me and his cigar together whenever he pleased. When my daughter Lillian first began to be brought out of the nursery she was as round and rosy a baby as ever you saw; but we had not been having her with us much as we sat together until she began to grow listless and pale, and lose her appetite. I called in our doctor, but nothing did her any good; she seemed to be just dwindling away, and she continued to dwindle until her father was called away on business for a month. Then she picked up, and was quite bright again by the time he came home. That happened several times, until I said to myself one day, as she was frolicking with me: 'Her father never saw her like this.' Then it suddenly flashed on me that there was something very strange about this. The upshot was, that we found beyond a peradventure that it was living in her father's tobacco smoke that was killing the child. I don't feel so much wiser than my mother now as I used to, and smoking at our house is again practiced on ancestral principles—at the top the house."

GLAD TIDINGS.

I think I shall have to claim a smoker of you, having ceased using tobacco. Send it, for I want some encouragement. When I first took GLEANINGS I paid but little attention to the Tobacco Column; finally, however, I got to reading the different accounts of those who had quit using the weed. I generally read them with a sarcastic smile, and a "it can not be did" sort of expression on my face; but, like the noted drop of water, it made an impression at last, and I thought that what man has done man can do. So here goes, and they went (tobacco and pipes). Of course, I agree to the conditions laid down by you regarding the smoker, if you send me one. JOB DAVIES.

Ballinger, Tex., Oct. 22, 1889.

Most certainly you deserve a smoker, friend D., and I should be very glad indeed to give away a thousand under just exactly such circumstances.

THE NOBLEST WORK OF GOD.

Please find two more claims for the smoker. Dewey Johnston, my neighbor, has started in the bee-business. I showed him GLEANINGS. He has concluded to quit the use of tobacco. I have smoked for 25 years. I quit on the 10th of last month. Now, if you see fit to send the smokers I will give you my word that, if we don't keep our pledge, I will send you the price of the smokers. "An honest man is the noblest work of God," so says Burns.

Waco, Neb., Aug. 19, 1889.

DANIEL MEKLE.

GOING SECURITY, AGAIN.

Will you kindly send Mr. Fred Karow, of Windsor, one of your smokers? He will pledge himself not to smoke, or use tobacco in any manner.

Should he, however, fail to fulfill his promise, I will pay for the smoker.

CHAS. REIDEL.

Windsor, Dane Co., Wis.

GOING SECURITY FOR A SON.

My son, A. B. Morgan, has quit the use of tobacco. I told him you would give him a smoker if he would quit. I will go his security; and if he commences again, I will see that he pays for the smoker.

Waynesburg, Lincoln Co., Ky. A. B. MORGAN.

MORE SECURITY.

Friend Root:—Still the good cause goes on. My friend N. E. Young promises to quit the use of tobacco, if you will send him a smoker; and if he ever uses it again, we or I will pay for it.

Anneville, Tex., July 14, 1889.

G. H. REED.

BREAKING AWAY FROM BONDAGE.

I have used tobacco with few intermissions, since I was six years of age. I am now 54. I read all that is said on the subject of tobacco in GLEANINGS, and have made up my mind to abandon the use of it, if I can hold out; and if I fail, I will pay for the smoker.

J. L. PELTON.

Sharon, Barber Co., Kan., Aug. 3, 1889.

THE FRUIT OF THE TOBACCO COLUMN.

My friend, Abner Sanders, has quit the use of tobacco after having used it for 17 years. Please send him a smoker; and should he use it again, I will pay you for the smoker. He was influenced to quit, partly if not wholly, from your Tobacco Column. Pray for him, that he may hold out faithful.

Bokoshe, I. T., June 17, 1889.

J. T. LEARD.

GOING SECURITY, STILL AGAIN.

I see in the Tobacco Column that several have quit the use of tobacco, and you sent them smokers. If this offer will hold good with a friend of mine, you will please send him a smoker. His name is Wesley Eakins. He used the filthy weed 26 years, and has entirely quit its use. If he ever resumes its use, I will pay for the smoker.

Herbst, Ind., Sept. 13, 1889.

NAT. HOGGALL.

THE OLD LIFE ENDED, AND THE NEW ONE BEGUN.

My nephew, Mr. Artie Flouse, of Coral, Mich., wants a smoker. After reading my GLEANINGS he concluded to quit the use of tobacco, and does it under the conditions given therein. He has smoked and chewed for a number of years, but has lately joined the Disciple church. He was baptized in the waters of a beautiful lake, and is now striving to walk in newness of life. If he breaks his pledge, I will pay for the smoker.

Coral, Mich.

LEMMON W. ITZENHouser.

HOW TO QUIT USING TOBACCO.

The way is very simple, and easily explained; and I will try to do so by giving you my experience with it. I commenced using tobacco when very young—so young that I can not remember my age. I became a great slave to it. I also learned the habit of using snuff—a mean practice, and one to be abhorred by ladies and gentlemen. But, to the point. How did I quit it? This is the way. I saw that I was committing a sin against God, so I determined to quit by his help. I took my sorrow to him in prayer. See Isaiah 53:4; Psalm 125:1. You can see by these how I conquered my lust for tobacco. Walk ye in it.

W. A. WILLIAMSON.

Friendly, W. Va.

CARRYING HIVES INTO THE CELLAR.

ALSO A NICE WAY TO GIVE THE CHILDREN A RIDE WHEN YOU HAVE NO HORSE.

SOME time ago, a correspondent (whose name and address was mislaid) sent us a very neat drawing, showing his method of carrying his colonies into the cellar. The drawing was accompanied with no description; and, in fact, little is needed. We have reproduced the drawing as below:

THE CHAIR METHOD OF CARRYING HIVES INTO THE CELLAR.

The chair, it is to be observed, is to be attached to the back of the bee-keeper, pack-peddler fashion, the hive having been previously secured to the chair by means of a cord. We tried the plan, and found that hives *could* be carried into the cellar, but there was so much trouble and toggery about getting the hives upon the chair that we concluded it was more trouble than it was worth. Either an assistant has got to lift the hives upon the chair, and secure them, or else the bee-keeper must himself put the chair upon a shelf or box nearly the height of his waist, so as to obviate the necessity of stooping when about to assume the burden. One man can carry quite a burden pack-peddler fashion, and perhaps some may find the hint of value. The experiment can be very easily tried, and without any particular outlay.

A PROPOLIS-KNIFE.

A HANDY LITTLE TOOL FOR THE PURPOSE.

SEND you by this mail a sample of my knife for cleaning sections of comb honey. It is the best thing that I have ever seen for the purpose, and I speak from experience, as I have used them for four or five years past in preparing many tons of honey for market, and have gained a

WRIGHT'S PROPOLIS-KNIFE.

reputation for clean and neat appearance of my honey in the market, which is partly due to the im-

plement and partly to the proper use of the same.

In reading the answers to an inquiry in GLEANINGS and the *American Bee Journal*, some time ago, as to the best tool for cleaning sections of honey, I was surprised to learn that most of the parties used an ordinary case-knife, and a few a jack-knife. I believe that those who give my knife a trial will concede its superiority, both for speed and workmanship. It can be made from an old case-knife or a cheap new one. I have made several from knives purchased from the five-cent counter. It needs touching up several times a day with a fine file, to keep the corners of the edge square and sharp. The edge is filed square across, and both sides filed down, so as to keep it less than a sixty-fourth of an inch in thickness at the edge, which makes it sharp enough to cut chunks of propolis out of the corners, but can not cut the wood. By grasping the knife near the point with the thumb and forefinger, using them as a gauge, the section can be cleaned all around the edges without injury to the comb; then go all around the outside of the section with the full length of the blade, which should be an eighth of an inch longer than the width of the section.

The past season has been the poorest for several years in this section, owing mainly to cold and rainy weather the fore part of the season.

Altamont, N. Y.

W. D. WRIGHT.

CONVENTION NOTICE.

The programme for the American International Bee Association, which is to meet at Brantford, Ontario, Canada, Dec. 4th to 6th, is not yet complete. However, from the following it will be seen that every effort has been made to have a good one. The first session will be at 2 P. M. of the 4th.

PROGRAMME.

Bee-keeping an Occupation for Women. Miss H. F. Bullers, Campbellford, Ont.

Cellar vs. Outdoor Wintering. R. McKinght, Owen Sound, Ont.

Shipping Queens. F. H. Macpherson, Beeton, Ont.

Disposal of the Honey Crop. Thos. G. Newman, Chicago, Ill.

Cellar Wintering. S. T. Pettit, Belmont, Ont.

Riding Hobby-horses; Bee-keeping a Recreation from other Pursuits, and an Antidote for Disease. E. R. Root, Medina, O.

Alimentary System, or Apparatus, of the Honey-bee. Prof. A. J. Cook, Agricultural College, Mich. S. Corneil, Lindsay, Ont., subject not given.

The president will deliver his annual address on the evening of the first day. Reduced rates, at least one and one-third fare for return trip, may be secured on Grand Trunk and Canadian Pacific Railways. The latter tickets must be purchased to and from Galt or Woodstock, and thence to Brantford via Grand Trunk Railway. For further particulars, apply to the secretary. Remember, you must have a certificate when purchasing your tickets for Brantford on Grand Trunk Railway, or Galt or Woodstock on the C. P. R'y. Reduced hotel rates (\$1.50) may be secured at the Herby House. The Commercial Hotel, also near the place of meeting, is a good one-dollar house.

R. F. HOLTERMANN, Sec'y.

Romney, Ont., Canada.

OUR HOMES.

I will both lay me down in peace, and sleep; for thou, Lord, only makest me dwell in safety.—Ps. 4: 8.

THE WAGES OF SIN IS DEATH.

AFTER visiting the German Sabbath-school, that I told you about in our last, I selected, among the great array of churches in Chicago, the Plymouth Congregational. I had had some little experience in finding places of worship in great cities, miles away, and so I inquired at the hotel about how far it was. As it was toward an hour's ride on the street-cars, I just had time to be on hand promptly, after the Sunday-school was out. Considerable has been said about the convenience of street-cars for taking people to places of worship. In a city like Chicago it would be a rather hard matter to get to many of the churches, without the aid of the street-cars or a horse and buggy. One reason why I did not go on foot was because of a lack of time; and another, the conductors on the street-cars are usually better able to direct you to any given locality than anybody else. They told me at the hotel what line of street-cars to take; therefore my first direction to the conductor was to put me off as near as possible to Plymouth Church.

"Plymouth Church?" said he. "Well, I'll be blamed if I know where Plymouth Church is."

Here he turned around to a car full of passengers, and called out, "Does any one know where Plymouth Church is?"

No one could tell. Then I bethought me that I had torn a list of the churches from a daily paper; and, sure enough, it gave the street and number. As I held it up to him he said, "Oh, yes! we run within half a block of it."

When we reached the vicinity of the magnificent structure I expected that the crowded car would be pretty well emptied, although I had noticed before that the conversation and appearance of the inmates of the car did not seem to be just what I should expect of church-goers. I felt a little sad when the car stopped to let me off, and I found that I was the only individual who stopped. Perhaps street-cars *do* carry people to church; but, my friends, I begin to be a little doubtful in regard to the matter. Next time, I think I shall start earlier, and go on foot, even if it is four or five miles. The voice of conscience had been whispering all along the route that I was not quite in a line, or, if you choose, I was not in the company, of those who "hunger and thirst after righteousness." Now, I realize that I have a great deal to learn about great cities. I realize, too, that I often make mistakes; and I believe that I am open to conviction in regard to this matter of running cars of any kind on the Sabbath.

Plymouth Church is the finest structure in the way of church edifices that I ever entered in my life. The audience numbered up into the thousands—I do not know how many. There were seats in the various vestibules, where strangers waited until the

ushers were ready to conduct them to the proper pews. The ventilation and heating were like a spring morning. I am glad to know that wealth has succeeded in giving us an atmosphere as pure and invigorating as we get outdoors, or pretty nearly that. The singing was equal to any, I think, I ever heard in my life; but I had just a little bit of feeling that a part of it would have been more appropriate—that is, letting your humble servant judge—for some weekday entertainment. I had quite a curiosity to see what the pastor of such a great and such a wealthy congregation looked like. He was a rather spare man, not above 35 or 40 years of age; but a very few words from him gave me the impression that he was able to command the attention of even that vast audience. The question kept coming up, "What does he possess above ministers in common that should have induced the people to call him to a place of such great responsibility?" Was it a fine and superior education? was it wonderful natural gifts? or was it the fullness of the Holy Spirit that carried conviction to the hearts of each one of his hearers almost in spite of him? I soon decided that it was a good deal of all together. Perhaps most of you know already that I am a little inclined to object to the ways and customs of the very wealthy—not that I want to find fault with them, but as a rule it is hard work for me to feel at home where money is expended lavishly. There is a sense of relief when I exchange living in the great hotels for that of my humble home. In the same way there is a sense of relief when I step from the palace cars into the companionship of the more humble working people of our land. I expected, or perhaps, rather, feared, that I should be a little homesick when the exercises of this great church were contrasted with those in our little town of Medina. Now, I believe there are extremes both ways. We should be as careful about being uncharitable toward the rich as we are toward the poor. Although I did not see people stepping out of the street-cars to go into this great church, I did see great droves of them stepping from magnificent equipages (many of them having liveried footmen) to open the carriage-doors, and to hand out the different members of the family. Great numbers of these footmen sat holding the horses during the whole of the services. I felt a little sad to see this; for at our church at home, nobody stays out of doors. Nobody, so far as I know, waits on his superiors while they worship God. This matter, however, is not in my province. Very likely Moody has taken up this subject already. I expected to attend his meetings while I was in Chicago, but he was temporarily absent at the time. Now about that sermon.

I can not remember the text. I do remember, however, that the pastor spoke of having read recent publications from the pen of some of our modern scientists. He mentioned that there is a species of philosophy becoming prevalent, to the effect that sin is not such an awful thing after all—that we are simply learning by experience.

Every child that learns to walk has a good many falls, and bumps its nose a good many times before he learns to be careful. In the same way, say the modern scientists, we commit sin—it is a part of our experience. We can not very well learn better until we have sown our wild oats, and become capable of looking on all sides of the question; therefore he who commits sin or crime need not feel so terribly bad about it; it is more or less the habit of every human life, and the world is step by step growing better. In the present age, and with our limited knowledge, it could hardly be expected that we should do any better than we do. We shall all get over sinning by and by, even if we do not make such a terrible tirade about it as some of the fanatics and extremists do.

While he was speaking I remembered that I had again and again heard the same kind of philosophy; for it is a sad fact, that there are men—yes, even teachers in science—men with fine education and intellects, who seem to seek some relief from a guilty conscience other than repenting of and forsaking their sins. They evidently turn to science for some relief or escape other than the only one ever opened since the beginning of the world—the relief through Christ Jesus. Without any personal acquaintance or knowledge of some who stand high as scientists, I have been led to feel from the very tone of their writings that they were guilty at heart—guilty, perhaps, of oft-repeated and deliberate sin. They try to delude themselves by the thoughts that the pastor expressed; and they seem to find a relief in trying to teach others that we are so constituted that we can not very well get along without more or less deliberate transgression. God says, "The soul that sinneth, it shall die." This class of modern scientists take it up in about the same strain that the serpent spoke to Eve—"Thou shalt not *surely* die." Of course, the speaker held up the Bible and Christ Jesus as the only relief and the only refuge. Here his eloquence waxed stronger and stronger. He held that great audience spellbound; and as I heard him plead for the dear Savior, wave after wave passed through my soul until I most fervently thanked God that such an earnest and powerful advocate had been raised up to publicly proclaim against the teachings of infidel scientists. The preacher spoke of sin and crime exactly as if he had been through the horrible miry depths himself. As he recalled some of the experiences of my own life I was fairly startled. He did not say in plain words that the experience he related was his own; but he made sin in the sight of God, if not in the sight of men, more hideous than I had ever seen it pictured before. As I went out it was with a fervent feeling of thanksgiving and praise that our great cities, with all their corruption and sin, are also provided with such earnest and faithful advocates of purity and righteousness as the one who had just delivered the message that God had given him. I had visited only *one* of the great churches, and their spires reach aloft through every part of the city. Who can count them? The Sabbath day [was

only a little more than half gone, and I had had two experiences—that of the German Sunday-school, and the sermon I have just mentioned, that was a surprise and a glad surprise to know that God is working with great power, not only in the basements of these grand and beautiful buildings, but even in the audience room; and I feel glad to think that Chicago, with all its great achievements, is scarcely a bit behind in its efforts to glorify God, and to spread the gospel of righteousness.

Now, dear reader, if you have ever been tempted to delude yourself into the idea that sin is not so awful bad, listen to the warning I have tried to carry to you to-day. A man in our jail once confessed to me, in an indifferent manner, a crime he had recently committed. I remonstrated, and tried to impress upon him the terrible consequences that must follow such an act. He broke out a little vehemently and said, "Why, Mr. Root, you don't know any thing about what is going on in this world. You are innocent and unsuspecting, and you think everybody else is the same. Why, there is not a man who walks the streets but has at some time or other been guilty of this very thing you make such a fuss about." My friends, his statement is not true; and even if it were true, it does not help the matter. He had deliberately broken one of God's plain, positive commands; and the bad, wicked, miserable life attested to the fact that he was reaping his reward. Perhaps he deluded himself with the thought that others had done the same thing, and repented and had been forgiven. I have even heard men quote the patriarchs of old as an example, that they might transgress and it will finally be overlooked and forgotten. The patriarchs of old were not forgiven unless they were truly penitent. It is true, that Jesus offers pardon as a free gift to all who will accept it. "Him that cometh to me, I will in no wise cast out." But, my dear friend, it is not such an easy thing to *come*, after a life of deliberate sin and crime. There is a boundary line; and those who deliberately transgress until this line is passed, do not, as a rule, turn back or repent. The words of one poor soul still ring in my ears. He was on his dying-bed, and in great agony of mind over his past wicked life. I searched the Bible for promises; but in answer to them all he said, "It is too late, too late." I was obliged to leave him, but I could not learn after his death that any peace ever came to his poor lost soul.

In our recent Sunday-school lessons we have learned much of David, and his life has been quoted in the way which I have mentioned. David was a godly man; but through the temptations of riches and power he became careless. A snare was set for his feet, and he fell. I believe, that from that moment his peace of mind and peace with God was gone. It never came back until he was entirely penitent, and had repented in dust and ashes. And even then, what anguish and torture racked his poor soul, even to the last days of [his] life—anguish and torture that he brought directly

on his own head by his own act! not only torture and anguish to himself, but a great stream of sin and crime threw its slimy folds down through generation after generation. One of his own sons committed a horrible crime that is so rare in our day that many do not even know the name of it. Another son *murdered* this brother, pretending it was to avenge his sister; but it is more likely that it was because this brother stood in his pathway to the throne. After that, he with consummate skill laid a plot to rob his aged father of the throne, and even planned to put his father to death, because he could not wait until the throne should come to him lawfully. To carry out his schemes he pretended to be pious. Now, it does not require a very close and acute study of the Scriptures to see that all this fearful bloodshed and catastrophe was almost the direct result of the decision of a single moment. Once in his life David consented to follow the promptings of Satan. He forsook the God of his youth, the God of his manhood, for a bauble that Satan held up to his gaze. Then he tried to cover up this sin. He was foolish enough to think that, because he was *king*, he could brave public opinion. If you want to know how he writhed under the tortures of a guilty conscience, read some of the Psalms. "Truly many sorrows shall be to the wicked; but he that trusteth in the Lord, mercy shall compass him about." A few days ago, by accident my eye caught on a single verse of a Psalm. By the way, I am now enjoying perhaps better health than I ever did before, but I still hold on to my noonday nap. I have tried going without it; but when I have much mental work, if it is missed I feel in some way unhinged all the rest of the day; my brain is cloudy and dim; but after having, say, ten minutes' sleep, or just enough to entirely lose consciousness, I am bright and clear all the rest of the day. Now, this text I am going to give you, I often think of when I begin to feel the need of this daily nap; and, by the way, I have discovered that, in order to drop to sleep instantly, I must have a *clear conscience*. Now, then, listen to the text that has of late become like sweet music to me: "I will both lay me down in peace and sleep, for thou, Lord, only makest me to dwell in safety." My friends, let me make *you* a present of *my* text. Take it with you to your day's toil, and hold fast to it when you go to rest after the toil of the day is over.

As you lose consciousness, let your last thought be in a line with the text; and when that last sleep that knows no waking shall come, may the thought be yours.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

GARDENING IN NOVEMBER.

AS a rule, most gardening operations, unless they are conducted under glass, are suspended, at least in this locality, during the present month. Our grounds are, however, making a very pretty show just now. For the first time

we have tried the Chinese Rose winter radish and Black Spanish. We are greatly pleased with both of them, especially with the Rose. Even when as large as a good-sized apples, they are perfectly crisp and tender, and not as strong as spring and summer radishes. We have had such fine radishes all summer long, that most of our customers were getting a little tired of them; but after they got a taste of the above, a brisk trade started up at once.

Spinach is making a beautiful growth, and we are having a brisk trade in it, at 3c a pound. The greatest trouble in getting it introduced is, that everybody will persist in calling it "greens." It is not greens any more than asparagus is greens, and it should be cooked something as we cook asparagus.

We are also having a nice trade in Purple-top Globe turnips. They are pulled before they get to be much larger than apples; and, cooked the same day they are gathered, they are excellent.

Of course, we have our greenhouse and cold-frames pretty well filled; but so far we have not had freezing weather enough to prevent all of these and other hardy plants from making a better growth outdoors than they do inside.

Celery is making a finer growth at this date, Nov. 13, than at any other time during the season; and we are furnishing our wagon with beautiful stalks of Self-blanching and Golden Dwarf, which goes off briskly at 10 cts. per pound.

We have very fine tomatoes yet on the wagon, that come from our greenhouses. The frost nipped the foliage a little, one or two nights, even through the glass; but they are now growing and ripening all right.

The Oregon everbearing strawberry is already putting out buds to blossom, both in the greenhouse and outside. There is certainly something peculiar about the persistent disposition of this strawberry to bear fruit all through the summer, and even late into the fall. The large strong plant, mentioned in our last issue, full of berries, has taken root, and the berries are slowly ripening. We are going to try hard to make them produce runners under glass. If we do, our friends shall have plenty of plants.

We have beautiful lettuce still growing finely in the open air. Grand Rapids seems to be very hardy, for late lettuce in the open ground, as well as for cold-frames or greenhouses. The new mammoth salsify is giving us roots almost like parsnips, and they are as great an improvement in quality as in size.

Burpee has also given us a mammoth crookneck squash that seems to be equal in every respect to the common crookneck, but it is ever so much larger. Now, where we get hold of a variety that is without question superior to the old one, as in the case of the summer crook-neck squash, etc., why not drop the old ones entirely? I know by experience that we want to be a little careful about deciding hastily; for on further trial the improved variety sometimes proves to be lacking in earliness, in quality, or in some other respect. But where the new variety proves to be in all respects su-

perior, I would drop the old one entirely. So far as I know, the Japanese buckwheat is an illustration in point. It is so much ahead of all our old varieties in every respect that there is no longer any need of sowing or offering for sale any of the old kinds. We are going to undertake this in our catalogue, for we can not have it cumbered with a great number of varieties where one or two answer every purpose for at least the great mass of the people.

AN INDESTRUCTIBLE LABEL FOR PLANTS AND TREES.

Simple as it may seem, it has long been a difficult matter to get just what we want for this purpose. In our book we have recommended having seed-packets printed on stout water-proof paper, and tacking this paper to a stout pine stake. Several times, however, these stakes have been pulled over by the harrow, and dragged in the dirt until even after a careful washing the letters were too much defaced to be read. In my experiments with early pumpkins I had a good deal of trouble in that way. We want a label that can be washed off when it is soiled. We want it to stand frost and rain and mud. Well, our good friends Johnson & Stokes, of Philadelphia, are bringing out something this season that fills the bill. It is made of very thin sheet copper—so thin that you can write on it with any sort of a pencil, and the writing will be indented so as to be easily read. In fact, thin sheets of copper, it seems to me, would answer for a writing that blind people could read. The slips of copper are about 3 inches long, and an inch wide. One end of this is narrowed down and split into two portions that can be easily twisted around a limb or stake. If this gets muddy it can be washed; and if you want to make it as clean as a new dollar, just heat them hot and throw them into water. The writing will still be perfectly plain. The price is the principal objection. They are worth \$1.50 a gross. It seems to me that they should be made for less than half this amount, and probably will be soon.

IMPROVEMENTS IN OUR COMMON VEGETABLES.

We have the following from our Ohio Agricultural Experiment Station. Our friend W. J. Green has given special attention to testing every thing new offered in this line:

We have an experiment in view, in which seed grown in your locality will be useful to us. We wish to secure seed of any or all of the following: Beans, beets, cabbage, cauliflower, celery, corn, cucumber, lettuce, melons, onions, pumpkin, peas, radish, squash, tomato, turnip, also grass, grain, or flower seed of any kind. It is essential that we know the locality where the seed is grown, also that the varieties be correctly named. Only a small quantity of seed is desired, about the same in quantity as seedsmen usually send in packets. If we can get no more than one variety from a locality it will be useful to us. We should like to hear from any one who has seed of any kind, of his own growing.

W. J. GREEN.

Columbus, Ohio.

HOW TO MAKE STRAWBERRIES BEAR IN AUGUST.

In GLEANINGS, Oct. 15, you call on the Experimen-

tal Stations to tell you some way to make the Jessie or some strawberry bear in the fall, when, by calling on your subscribers, I have no doubt you could find plenty who could tell you the secret. If you will select some thrifty plants next spring, and pick out the fruit-stalks before they bloom, and keep all runners cut, you will have the satisfaction of seeing them bloom in August and mature fine fruit. We have a gentleman near this place who sold quite a number of plants because he could raise berries and have them to sell in September.

E. F. BUSICK.

Church Creek, Md., Oct. 23, 1889.

Friend B., you give us something exceedingly valuable. I have often thought of doing as you say, but I could never before find any record of anybody who had done it. Next season we will make a good test of the matter.

HOW TO MAKE SOUR-KRAUT.

In response to information wanted, "How to make and keep sour-kraut," I submit the following *very simple way*: Cut your cabbage up finely, and put about half a bushel of the cut cabbage in the barrel you intend your kraut to stay in; then sprinkle over it as much salt as you can hold in your hand; then with a wooden maul beat it down. Next put in the same quantity of cabbage, using a handful of salt to every half-bushel of cabbage, beating the cabbage down every time you put it in. It takes a good deal of beating. You can tell when it is beaten sufficiently, by the brine rising near the top. When you are done putting all your cabbage in the beating, etc., cut some boards to fit inside the barrel. Put boards on top of the cabbage, and then put a heavy weight on top the boards. Next morning the brine will stand on top. Put your barrel in the cellar or some cool place, and in a few days you will have kraut that will keep all winter and spring. Freezing will not hurt it unless you gouge down in the middle or on one side of the barrel, thus allowing the brine to sink away from the top. As you use your kraut, keep it level on top, and the weight on. When you are making your kraut, if you will peel your cabbage-stalks and throw them into the barrel you will have some nice pickles; and every time mamma goes to get a mess of kraut for dinner, all the children will want a stalk to eat.

G. C. HUGHES.

Pipestem, W. Va.

EGG-PLANTS IN FLORIDA.

I have already 3000 egg-plants out, and they are looking finely. The plants are set out 4 feet each way, and you will be surprised to know that my patch of egg-plant will be good from 3 to 5 years for fruiting, all because we have no killing frost.

Narrows, Fla., Sept. 23, 1889.

S. B. DAWSON.

LIMA BEANS WITH A VENGEANCE, ETC.

We are now having the heaviest rains for October that we have had in 38 years. It has now rained over four inches, doing great injury to beans still unthrashed. There are close on to 2000 tons of limas still in the field. The season starts in good for honey, but nearly all the bee-ranges were burned over in Southern California last month, which will give us a light crop of sage honey, as the sages make no bloom the first year.

S. M. W. EASLEY.

San Buena Ventura, Cal., Oct. 23, 1889.

GLEANINGS IN BEE CULTURE.

For Clubbing Rates, See First Page of Reading Matter.

MEDINA, NOV. 15, 1889.

In peace will I both lay me down and sleep:
For thou, Lord, alone makest me dwell in safety.
1 Or, IN SILENCE. PSALM 4: 8, Revised Version.

DEATH OF MRS. CHADDOCK.

As we go to press, the following reaches us:

Mrs. Mahala B. Chaddock died at her home in Vermont Tp., Fulton Co., Ill., at 8 o'clock on the evening of Nov. 12. She had been ill for five weeks, but not dangerously so, until toward the last, when typhoid pneumonia developed and caused death. ANNA B. QUITLIN.

Mrs. Chaddock, by her spicy writings, was well known through these columns; and her sudden death will be lamented by many of our readers.

QUEENS FROM THE SOUTH.

The following queen-breeders from the South agree to furnish untested queens during the winter:

Simon P. Roddy, Mechanicstown, Md., has four nice tested queens which he will sell for \$1.00 each.

I can send out young tested queens during the winter, if wanted. NELLIE ADAMS.
Sorrento, Fla., Oct. 28, 1889.

Untested Italian queens all winter, ready by return mail, at price in Root's catalogue. If sent at buyer's risk, one-half of Root's price. LUTHER W. GRAY.
Orlando, Fla., Nov. 9.

I have about six untested Italian queens which I will send to any address upon receipt of \$1.00 each, by return mail. New Braunfels, Texas, Nov. 9. H. H. P. KOHLENBERG.

I have untested queens now ready to ship. J. P. CALDWELL.
San Marcos, Tex., Nov. 7.

A HONEY ALMANAC.

The Honey Almanac for 1890, published by T. G. Newman & Son, Chicago, Ill., is now out. It contains 32 pages of facts, figures, and suggestions, for honey in its various uses, besides the matter usually contained in almanacs. A very large number of honey recipes for cooking are compiled. The varied uses of honey as a food and medicine are also discussed. The design of this almanac is to place in the hands of bee-keepers a lever by which they can revolutionize public sentiment, and create a market for honey. Sensational stories in regard to adulterated honey are refuted. The following is a pithy paragraph which sums up the whole story:

THERE IS NO ARTIFICIAL COMB HONEY.

"Combs made of paraffine, filled with glucose, and sealed over by machinery made for that purpose"—is a mere fabrication! A LIE! That story was started by Prof. Wiley, in an article for the Popular Science Monthly which he says was intended simply as a "scientific pleasantry." He expresses surprise that any one should ever have taken it for a sober fact. It was intended for a "huge joke," but the newspapers have been deceiving the public by asserting that it is truth. Several years ago, Mr. A. I. Root, of Medina, O., offered a thousand dollars for proof of the existence of such a factory, and to see such artificial comb made. He has never had an application for the money—good proof that there is no such thing.

FATHER LANGSTROTH.

The following editorial from the *American Bee Journal* of Nov. 2, we take pleasure in presenting to our readers. It contains a bit of news in regard to our much-respected friend, and some cheering words from the editor that are well worth repeating. It is as follows:—

The Northwestern Bee-Keepers' Society at its last session voted to empty its treasury into the

pocket of our venerable friend father Langstroth. Accordingly, being the treasurer, we sent him a check for the amount, \$12.25, together with another small amount sent to us by one of our subscribers for that purpose. The following is the response from Mrs. A. L. Cowan, his daughter.

Mr. THOMAS G. NEWMAN:—My father is deeply grateful to the bee-keepers for their remembrance of him. He is still sad and feeble, and I appreciate highly every kind act which lightens for a time the clouds which surround him—by the knowledge that his labors are not forgotten.

My father sends his kind greetings to you and to your family. We are grieved to learn of Mrs. Newman's illness. I have suffered so often from the same terrible disease (erysipelas), that I know how to sympathize with her. With best wishes for her speedy recovery. Respectfully,

Dayton, O., Oct. 22, 1889.

ANNA L. COWAN.

"Sad and feeble"—how these words send gloom to our hearts! Has that kind face, genial smile, and sweet voice, given place to sadness, because of the feebleness and natural decline of the physical system? Be not sad, noble brother. Though "weeping may endure for a night, joy cometh in the morning!" Cheer up, and remember Him who says, "When thou passest through the waters, I will be with thee." With eyes fixed on him to guide through the deep waters, and through the pearly gates, we hope with you soon to be made "living stones in that temple not made with hands, eternal in the heavens"—where "no discordant voice shall e'er be heard, and all that we experience will be perfect bliss, and all we express will be perfect praise," and where "love divine will ennoble every heart, and hallelujahs exalted employ every tongue."

MEMBERSHIP TO THE N. A. B. K. A.; AN INTERNATIONAL BEE-ASSOCIATION AT THE WORLD'S FAIR IN 1892.

A LETTER just received from Secretary Holtermann will explain itself. It reads as follows:

FRIEND ROOT:—I should like to see the International American Bee-keepers' Association what it should be; and it should have, in its treasury, funds to defray the expenses of an international convention at no distant date, say during the World's Fair in New York, 1892. As I have before said, who knows the grand results which may be secured from a convention of bee-keepers of the World? To do this we must commence at once; and I propose that every one who can, shall send one dollar as membership fee to the International for the coming year; and, as far as I am concerned, if the surplus be voted to me for the work of the past year, I will turn it over to the treasurer, to remain as funds of the association. Surely very many will be found who will indorse this scheme, or something like it, and send their dollar. We should no longer have an empty treasury. R. F. HOLTERMANN.
Romney, Ont., Nov. 1, 1889.

We most heartily indorse what friend Holtermann says. It has been said several times, and with some truth too, that the N. A. B. K. A. in its meetings is largely a local affair. If we can not secure the attendance of representative bee-keepers from all parts of the United States, let those who are interested in the success of the Association send in their one-dollar membership fees. The programme as announced elsewhere in these columns promises to be interesting, and friend Holtermann has left no stone unturned to make the meeting a success. In regard to the international at the World's Fair, we feel sure that we ought to begin to think somewhat of the matter. We want an exhibit at that fair which will be a credit to our industry in this country. We also want an international convention, international in name and international in reality. It will be a fine thing if French, German, English, Italian, Spanish, and American bee-keepers (and that includes Canadians too) could rub against each other in one grand brotherhood of representative world's bee-keepers. We should like to hear what our European cotemporaries think of the matter.

Since writing the foregoing, the following, from the pen of the president of the association, has come to hand:

FRIEND ROOT:—Please say in next GLEANINGS that several in Canada and the United States have suggested to me that it would be a good plan to request those who attend the convention at Brantford next month to take along with them samples of both comb and extracted honey, say one or two

pounds, so that we may see and taste honey from different parts of America. Those not in attendance, and so desiring, could send theirs to the convention (care of the secretary, charges paid), each package marked, kind of honey, price in their market, and owner's name. The convention could appoint judges if they thought best. I like the idea myself, and will second the motion." A. B. MASON, Pres.
Auburndale, Ohio, Nov. 7, 1889.

The idea is a good one, and we will second the motion; and we feel sure that every other member will do so by bringing along with him samples of honey produced in his locality. We should like to have some of the convention test some of the nice alfalfa honey mentioned elsewhere. We hope that friend Ball, or some other bee-keeper of that irrigated district, will favor the convention with their presence, or at least with samples of their beautiful honey.

SPECIAL NOTICES.

DISCOUNT FOR EARLY ORDERS.

Those who expect to take advantage of a discount for ordering during our dull months will find, by referring to our discount notice on the inside of the cover, that the discount during this month is 4%, and on Dec. 1st it drops to 3%. Order during the next two weeks if you would secure the extra 1%.

EXTRACTED HONEY WANTED.

We have met with an unexpected outlet for our stock of extracted honey, and we should be pleased to receive samples from those who have a choice article of basswood or clover to sell or exchange for supplies. When you send a sample, write how much you have and how it is put up, and what you will take for it. By doing this we can give it one free notice in the Honey Column, if we can not use it ourselves.

PREMIUM LIST.

We call our readers' attention to our large premium list in this number. If by chance it slips out and you fail to get it, or if you lose it, be sure to let us know, so that we send you another. We would advise you to keep it in a safe place, for reference. Besides the many bargains we offer you, you may do well to look over the advertisements in the front and back, and see if you do not find something there to your advantage.

EXTRA QUANTITY OF THIS NUMBER.

We use, in printing this number and the premium list, about 70,000 white sheets of paper, 21 x 27 inches, besides the covers, of other colors. This is over three times the amount used in a regular issue. We print an extra number, to be distributed as sample copies, and therefore this will be read by some who may never have seen GLEANINGS before. We ask you to read the number carefully in all its departments, and see if it would not be a good investment of \$1.00 to have such a magazine come into your home twice a month for one year; 24 numbers, or about 4 cents each. Send your subscription, and try it a year.

ODD BUT TRUE.

Send me the names of 10 regular subscribers to the American Agriculturist, or Ladies' Home Journal, and I will give you next season your choice of the following: 1 untested Italian queen, 13 Laced Wyandotte eggs, 13 B. Leghorn eggs, or 10 S. S. Hamburg eggs. All I want is the names of 10 persons who take either of the papers. Write for catalogue of nearly 2000 papers at reduced rates.

C. M. GOODSPEED, Thorn Hill, N. Y.

(Persons responding to this advertisement mention GLEANINGS.)

Wants or Exchange Department.

Notices will be inserted under this head at one-half our usual rates. All ads intended for this department must not exceed 6 lines, and you must say you want your ad in this department, or we will not be responsible for any error. You can have the notice as many lines as you please; but all over five lines will cost you according to our regular rates. This department is intended only for bona-fide exchanges. Exchanges for cash or for price lists, or notices offering articles for sale can not be inserted under this head. For such our regular rates of 20 cts. a line will be charged, and they will be put with the regular advertisements.

WANTED.—To exchange honey for beeswax. We will take beeswax in exchange for honey in any quantity. Will give three pounds for one. Write for particulars. CHAS. DADANT & SON, 187fdb Hamilton, Hancock Co., Ill.

WANTED.—To exchange improved Hammononton Incubator, capacity 240 eggs, new, for honey or offers. A bargain. FINIS A. WOOTTON, 20-21d Skilesville, Muhlenberg Co., Ky.

WANTED.—To exchange a Barnes foot-power saw and Pelham fdn. mill, for extracted honey. Both saw and mill are as good as new. 22d R. H. CAMPBELL, Madison, Morgan Co., Ga.

WANTED.—To exchange No. 1 sections for extracted honey or beeswax. M. H. HUNT, 22-23 Bell Branch, Mich.

WANTED.—To exchange Japanese buckwheat, \$1.25 per bushel, for Eddy drill or offers. 22d F. C. FULLER, Montague, Mass.

WANTED.—A Given foundation-press in exchange for hives, foundation, or supplies. Press for L. frame. O. F. SUNDERLAND, 22d Box 411, St. Albans, Franklin Co., Vt.

WANTED.—To exchange fine P. Rock cockerels, also comb and extracted honey, for bee-supplies or offers. H. A. HUBBARD, New Lisbon, N. Y.

WANTED.—To exchange a Perfect Hatcher incubator, capacity 750 eggs, Japanese buckwheat, and Kafir corn, for honey. CHAS. D. DUVAL, 22-23d Spencerville, Montgomery Co., Md.

WANTED.—To exchange a 24-inch Kaestner feed-mill for small planer, V-groove section machine (Root's), or offers. GEO. RALL, 22-23 Frenchville, Wis.

WANTED.—To exchange 200 colonies of bees, 2 foot-power saws, and one foundation-mill and tanks, for any thing useful on plantation. 22fdb ANTHONY OPP, Helena, Ark.

SUPPLEMENT.

PICTURE GALLERY OF GLEANINGS IN BEE CULTURE.

DURING the 17 years in which GLEANINGS has been published, a large number of fine engravings of apiaries and bee and honey exhibits have been presented to the readers. They were executed at considerable cost, and are also suggestive of many ideas with regard to apiaries and apiarian exhibits. Those of the better sort we take great pleasure in presenting to our readers again, in the shape of a souvenir, and we trust it will be appreciated. Our list is double, and in some instances perhaps three times the size it was when the pictures originally appeared, and hence to the majority of our readers they will be new. Perhaps we should remark, that these engravings will appear in the A B C of Bee Culture, just after the biographical sketches. The two together will give an excellent idea of prominent apiarists, and of their apiaries: of prominent honey-men and of their honey-exhibits, from all parts of the world. While it is not possible, by reason of space, to give descriptive reading-matter for each, we have indicated the page and volume in which full details can be found. If you do not happen to have the required back number, describing a certain exhibit or apiary, send 10 cts., and we will mail you the desired number.

RERUM COGNOSCERE CAUSAS,

TO know the Causes of Things, is the key to Success in any industry. If you wish to succeed in the **Bee Business**, you must read and become acquainted with the most Successful Methods of Bee-Management and Honey-Production.

LANGSTROTH'S WORK,

REVISED BY DADANT,

Contains the result of practical experience with Bees. It gives the Physiology of the Bee, with numerous **Quotations** from the latest Scientific Writers, the Description of the **best Hives**, Directions for the Proper Management and Handling of Bees; the most **Practical Methods of Queen-Rearing, Swarming** (Natural and Artificial), with controlling methods; instructions on Establishing Apiaries, Transferring, Shipping, Mailing, Feeding, Wintering; the best methods of producing **Comb and Extracted Honey**, the Handling and Harvesting of Honey, the Making of Comb Foundation, etc., etc.

The instructions for the **Rendering of Beeswax** are alone worth the price of the Book, to many bee-keepers who waste a part of their wax in rendering it.

This book, "the most complete ever published," is shortly to be published in the French, Italian, and German Languages, by Practical European Apiarists. It is highly recommended by all publishers of Bee-Literature in the Old World as well as in the New.

Cloth Binding, 550 Pages, 199 Engravings, 19 Full-Page Plates. Gilt front and back. This book is an Ornament to any Library.

Price: By Express, \$1.85. By mail, prepaid, \$2.00. Special prices to Dealers who wish to advertise it in their circulars.

We also offer for Sale, **20,000 Lbs. of Honey**, of our crop of 1889; **25 Tons of Comb Foundation**, Smokers, Bee-Veils of Imported Material, etc. Send for Circular. Address

Wants or Exchange Department.

Notices will be inserted under this head at one-half our usual rates. All ads intended for this department must not exceed 5 lines, and you must say you want your ad. In this department, or we will not be responsible for any error. You can have the notice as many lines as you please; but all over five lines will cost you according to our regular rates. This department is intended only for bona-fide exchanges. Exchanges for cash or for price lists, or notices offering articles for sale can not be inserted under this head. For such our regular rates of 20 cts. a line will be charged, and they will be put with the regular advertisements.

WANTED.—To exchange honey for beeswax. We will take beeswax in exchange for honey in any quantity. Will give three pounds for one. Write for particulars.
CHAS. DADANT & SON,
18tfdb Hamilton, Hancock Co., Ill.

WANTED.—To exchange a 24-inch Kaestner feed-mill for small planer, V-groove section machine (Root's), or offers.
GEO. RALL,
22-23 Frenchville, Wis.

WANTED.—To exchange 200 colonies of bees, 2 foot-power saws, and one foundation-mill and tanks, for any thing useful on plantation. 22tfdb
ANTHONY OPP, Helena, Ark.

WANTED.—To exchange No. 1 sections for extracted honey or beeswax. M. H. HUNT,
22-23 Bell Branch, Mich.

WANTED.—To exchange a Barnes combined foot-power saw, for extracted honey. A good machine, cheap, used but little; cost \$35.00; price now, \$18.00. Please write at once.
GEO. BREDE, Sandwich, N. H.

WANTED.—To exchange a Perfect Hatcher incubator, capacity 750 eggs, Japanese buckwheat, and Kafir corn, for honey. CHAS. D. DUVAL,
22-23d Spencerville, Montgomery Co., Md.

WANTED.—To exchange two saw-tables designed for making dovetailed sections, for sections.
W. S. WRIGHT, Battle Creek, Mich.

WANTED.—To exchange Japanese buckwheat at 75c per bushel, or No. 1 sections, for extracted honey.
W. D. SOPER, Jackson, Mich.

WANTED.—To exchange a fine-blooded stallion for Italian bees. Will take a quantity of sections and foundation. A bargain for somebody.
J. H. JOHNSTON, Leclair, Iowa.

WANTED.—To exchange complete photograph outfit, for Barnes foot-power saw.
F. SHILLING, Jewett, Harrison Co., Ohio.

WANTED.—To exchange wood-engraving tools for carving-tools.
E. V. WHITTLESY,
Pecatonica, Winnebago Co., Ill.

WANTED.—To exchange a new foot-power saw for extracted white-clover or basswood honey.
23d W. S. WRIGHT, Battle Creek, Mich.

WANTED.—To exchange, Barnes foot-power buzz saw, latest pattern, one Parker Bros. shotgun, B. L., new, for type-writer or any thing can use in family.
ADOLPHUS NEWTON,
Box 911, Norwich, Chenango Co., N. Y.

HONEY COLUMN.

CITY MARKETS.

CINCINNATI.—Honey.—There is a large amount of comb honey on our market. Sales have been slow lately and prices are easier. It is held at 14¢ for best white in the jobbing way. Extracted honey brings 7¢ on arrival. *Beeswax.*—Demand is good at 20¢ for good to choice yellow on arrival.

CHAS. F. MCETH & SON,
Cincinnati, Ohio.

Nov. 22.

KANSAS CITY.—Honey.—Honey is selling very slow, especially extracted. We attribute the cause some to the mild weather. We quote: 1 lb., white comb at 13¢ 14; 1 lb., dark, 10¢ 12; 2 lb., white, 12¢ 13; 2 lb., dark, 10¢ 11. Extracted, white, 7¢ 8. *Beeswax*, 22¢.

CLEMONS, CLOON & CO.,
Kansas City, Mo.

Nov. 22.

BOSTON.—Honey.—Honey is selling a little slow. Fancy white one-pound combs jobbing, 16¢ 17¢; common, 15¢ 16; extracted, 8¢ 9. *Beeswax*, 24¢.

BLAKE & RIPLEY,

Nov. 27.

57 Chatham St., Boston, Mass.

ST. LOUIS.—Honey.—Market steady. Better inquiry. Comb, 12½¢ 14 for choice; 8¢ 10 for inferior. Choice extracted, 5¼¢ 6; dark, 5¢ 5½. *Beeswax.*—Prime, 22¢.

D. G. TUTT GROCER CO.,
St. Louis, Mo.

Nov. 22.

ALBANY.—Honey.—The market is slow and weak. White clover, 13¢ 14; mixed, 11¢ 12; buckwheat, 9¢ 11. Extracted, light, 8; dark, 6.

Nov. 22.

H. R. WRIGHT, Albany, N. Y.

DETROIT.—Honey.—White comb honey in fair demand at 13¢ 15¢. Fall made, 12¢ 13. *Beeswax*, 24¢ 25.

Nov. 22.

M. H. HUNT, Bell Branch, Mich.

FOR SALE.—Six 60-lb. square cans, heart's-ease honey, crated. Will take 7½¢ at Hamilton, Caldwell Co., Mo.

C. B. THWING,

Evanston, Cook Co., Ill.

FOR SALE.—Three 60-lb. cans of honey like the sample sent you (fair); I will take \$5.00 per can for it on board the cars in Addison.

THADDEUS FISK, Addison, Lenawee Co., Mich.

FOR SALE.—300 lbs. white-clover and 350 lbs. gold-enrod comb honey at 15¢ and 12½¢ c respectively, put up in 12, 14, and 20 lb. crates. Would exchange some for good extracted honey.

23d

L. J. TRIPP,
Kalamazoo, Kalamazoo Co., Mich.

FOR SALE.—17 kegs of clover honey that hold 15 gallons each, or 177 lbs. each net. I would like to get 8¢ for it here on track, no charge for kegs.

MONT WYRICK, Cascade, Dubuque Co., Iowa.

FOR SALE.—Three barrels of clover honey of about 600 lbs. each, about 1800 lbs., for which I will take 7¢ per lb. here on board cars.

GEORGE W. CAVE, Kirkwood, Warren Co., Ill.

CONVENTION NOTICES.

The next annual meeting of the Vermont Beekeepers' Association will be held at Burlington, Vt., Jan. 22, 1890.

J. H. LARRABEE, Sec'y.

The first annual joint meeting of the bee-keepers of Huron and Tuscola Counties will be held Dec. 15, 1889, at Sebawaing, Huron County, Mich. The committee has secured a fine hall, which will be at our disposal during the convention. The hall is at and in connection with the Union House, and is known as Concordia Hall. We earnestly ask all interested bee-keepers to be present, and help to make this our first convention a success.

J. G. KUNDINGER, Cor. Sec'y.

REDUCED RATES OF TRAVEL TO THE CONVENTION AT BRANTFORD, DEC. 4, 5, AND 6.

Applications for railroad certificates are pouring in, and the prospects are very bright indeed. Our friends in the United States can get reduced rates only on Canadian railways. Upon Canadian Pacific Railway and the Grand Trunk they must repurchase to the nearest Canadian point, and from there to Brantford a ticket with a certificate. Those traveling on the C. P. R. can purchase a ticket for Woodstock or Galt, and then to Brantford via C. T. R. When two railway lines are used, two certificates to fill out must be secured from me. At Brantford the following hotel rates have been secured at the Kirby House: Regular rates, \$2.00; rate to members, \$1.50. Commercial Hotel, regular rate, \$1.00; rate to members, 75 cts. per day.

Both hotels are within less than a block of the City Hall, at which place the convention will be held, Dec. 4, 5, 6, 1889. There is a sample room for the display of honey bee-keepers' supplies, etc., so all should bring something.

R. F. HOLTSMANN, Sec'y.

KIND WORDS FROM OUR CUSTOMERS.

Please mail me three or four of your seed catalogues as soon as out, and I will hand them to friends with my opinion. My seeds were of the very best, and a half cheaper than elsewhere. I can send orders for \$100 worth of seeds alone.

Lewiston, Ida., Nov. 10, 1889.

L. A. PORTER.

HOW TO FIND A CUSTOMER FOR HONEY.

You need not put my advertisement in again. The postals and letters come in nearly as fast as I could read them. If you have more than you want of honey, just tell it in GLEANINGS, and away she goes. I received letters of inquiry before I received GLEANINGS. I was "just astonished, I was." The advertisement, "Bees for Sale," you may omit. Elsie, Mich., Nov. 24, 1889.

N. L. HIGBIE.

A few weeks ago I wrote a second time to have GLEANINGS stopped. You very kindly did so, or, rather, I should say you were kind enough to send your check for \$100 for the year when I did not want it. Really this is too generous. I read your paper all that time, and think I got my \$1.00 worth of information; so I return your check, with a feeling that I have at last found what is popularly not supposed to exist; viz., an editor with a soul. Perhaps it may be of interest to you to know that GLEANINGS is on file here in the Agricultural reading-room, and also that Prof. Comstock conducts a summer course in apiculture in the university.

Ithaca, N. Y., Oct. 9, 1889. J. VAN WAGENEN, JR.

Save 10 Per Cent.

SAVE TEN PER CENT AND ORDER YOUR SUPPLIES THIS MONTH.

We carry a complete stock of Sections, Hives, Smokers, etc. Illustrated catalogue for your name on a postal card.

OUT-APIARIES, NO. XX.

GENERAL REMARKS—PICNIC DINNERS, ETC.

HAVING talked over the main ground of what is peculiar to the work of out-apiaries, I want the liberty of a little desultory talk. I find there is a growing feeling among beekeepers that they want to keep a smaller number of colonies in an apiary for best results, and, somewhat as a result, the number of out-apiaries is on the increase. I am not so sure that some are not making mistakes. What is just right for one man is not always best for another. With your time and surroundings it may be better for you to limit or lessen the number in your home apiary and confine yourself to that. You may be very successful in a single apiary, doing all the work yourself, and make a dismal failure if you attempt to run a number. Then it's one thing to have a force of hands present with you all the time, going from apiary to apiary, and quite another to have each apiary separately manned. Feel your way, and find out just what you can best do.

In the new Langstroth on the Honey-Bee, so excellently revised by Dadant, he very wisely says: "Do not put your bees on land which is tenanted. Let them be placed at some responsible farmer's own home, for a tenant may leave on short notice, and you can not remove your bees at all seasons." I may add, that it is much pleasanter to go each year to the same place, as you get better acquainted.

When you leave for the winter, be sure that every thing is picked up and left in neat shape at the out-apiary—nothing to offend the eye of the farmer's good wife every time it happens to stray in that direction. And here I must confess the superiority of womankind. Many a time when the shop or apiary appears to be in dire confusion, I say to my

wife or Emma, "It's a hopeless case. You're welcome to all the physical strength I have—tell me just what you want me to do, and I'll obey orders implicitly, but don't ask me to engineer the thing."

Another thing in which a woman's presence and skill are appreciated is in the matter of lunch. Of all the meals we eat, I think none are enjoyed so much as the dinners at the out-apiaries. Of course, every thing is cold, but the weather is such that we're not anxious for hot things. Under the shade of the trees in the pure air, a cloth is spread on some hive-covers, at a safe distance from the hives, so no scolding bees will be around, and the few articles of food are placed thereon, with no superfluous garniture in the way of dishes beyond what are actually needed; seats are taken, God's blessing asked, and we eat with a relish that might well be envied by those who sit before carved tables loaded with costly viands in dishes of silver and gold.

Sometimes our work is such that we visit one out-apiary in the forenoon and another in the afternoon; and by way of variation we stop at some pleasant point on the road between, and, without leaving our seats, eat our dinner. I say *dinner* rather than *lunch*, because it is the principal meal of the day. Although it may not be convenient, if indeed it were best, to have a great variety at one of these out-door meals, the bill of fare from which we may select for different days is by no means small, including cold meats of all kinds, the different canned goods including fruits, fish, oysters, etc., fresh berries, sandwiches, bread and butter, boiled eggs, morning's milk in a Mason fruit-can, cold asparagus, peas, beans, etc.

You can see that it's a sort of picnic every day. I must say that, if even the plan of having each one isolated at a separate apiary were just a little more profitable, I should still prefer to keep the crowd together, and I should want no discordant element,

as nearly as possible just like a family, and all having such an interest in the work as to make it a pleasure to talk over together the plans and prospects.

C. C. MILLER.

Marengo, Ill.

Friend M., there is one thing in your remarks that takes a mighty hold on your old friend A. I. Root. God's blessing is asked on the cold lunch spread on top of a beehive. No matter how busy you are—no matter how commonplace may be your surroundings, in the middle of the day and in the midst of the work you all agree to come to order, or, if you choose, you call yourselves to order while the divine blessing is invoked. I know we do not always feel like it; at least (and I am ashamed to say it) I do not always feel like it; but that is the very time when it is of the utmost importance that we bow our heads in reverence to the great Ruler over all. Asking the blessing seems to settle the troubled waters, and it always has the effect of making all the good there is in me come uppermost or to the surface, and also of making all that is bad or wrong go away out of sight. If I had been cherishing a wrong feeling when it comes time to ask a blessing, the wrong feeling must be put away, crowded down out of sight. Nine times out of ten it stays down out of sight, and perhaps never shows itself again. Perhaps some new reader of GLEANINGS may inquire, "Well, what has all this to do with out-apiaries?" Simply this, my friend: It will oftentimes of *itself* decide between success and failure.

SETTING BEES IN THE CELLAR, ETC.

FRIEND DOOLITTLE GIVES US SOME GOOD HINTS ON A SEASONABLE MATTER.

I AM frequently asked which is best, a cold day or a warm one, to set bees in the cellar; and I invariably reply, that I prefer the warm one. I never set bees in the cellar when they went in with as little trouble as this year. Two days before, they had a nice fly, the mercury going to 63° in the shade, with scarcely a cloud or a bit of wind. That night and the next day the weather was very drying, while on the morning of the second day it looked as if fixing for a storm. I said to myself, "Now is the time to put the bees in the cellar;" but upon looking at the thermometer I found that it marked 52°, while bees can fly at 45°. I was a little afraid that I might have trouble with their flying while it was so warm; but I resolved to try, and, to my astonishment, I found that I never set bees in the cellar when they flew as little or were disturbed less than with this warm temperature. As the hives were not frozen down on the bottom-board, they lifted off the same without a bit of jar, thus helping much in the matter. To keep from jarring them in carrying to the cellar I placed several thicknesses of old carpet on the spring wheelbarrow, letting the same run up over the front board, to which it was tacked on the back side, to keep it from slipping down. The hives could now be set on the wheelbarrow without the least bit of jar; and as the work of carrying them into the cellar seemed rather uncalled for, after I had them at the door of the cellar I conceived the

idea of laying down a couple of plank, which made it just right so that I could run the wheelbarrow right into the cellar, and thus bring every hive to the place where it was wanted, so that all the lifting there was to it was the setting them on the barrow and off again. Only now and then a colony seemed to realize that they had been disturbed at all, and I believe that it will be quite a little in their favor for safe wintering, in their not being disturbed in putting in. I can not help but think that it is much better to put bees in thus early in warm weather, than to wait till into December, as some advise, when it often happens that the hives are covered with ice and snow, and the inside of the same covered with frost, the melting of which causes a dampness to the cellar and hives not beneficial to the bees.

HOW TO WINTER THE HIVES WITH HALF-DEPTH FRAMES.

I have had very many letters since my article appeared in September GLEANINGS about "Non-swarmers," speaking in very high terms of the same, and many ask how I intend to winter the bees in these half-depth frames. My way of fixing them is this: After the honey season is over I look them over to see what honey they have in the combs; and whether I find any or not, I place eight combs which are the nearest empty of any, next to one side of the hive, when the other half of the hive is placed on top of this one, the same as used in the early part of the season. During the season I have used some of these half-story hives on the colonies which were worked for extracted honey, looking toward the wintering of these colonies; and as fast as they were filled they were set away for this very purpose, so that all I have to do at this time is to go to these hives stored with combs of honey and get eight frames from them, which are generally so well filled that they will weigh three pounds each, so that the eight contain 24 pounds of honey, which is the right amount the bees need for winter. These are set in the upper half of the hive, directly over the others in the lower half, when a division-board, such as is used in full-depth hives, is set in next to the combs, thus making a hive a foot square for wintering, with a passageway through the center of the combs for the bees to pass and repass as the cluster contracts or expands during the winter. In this way I get a deep hive for wintering, which some contend is better than a shallow one; and I get the bees in a snug compact form for winter, which my old teacher, E. Gallup, claimed to be of great advantage, and do away with the Hill device, or the cutting of holes through the combs for winter passageways, as nearly all bee-keepers think must be done. The space between the division-board and the end of the hive is now packed with chaff; and if they are to be wintered on the summer stand they are packed all around with chaff between the outside shell and the hive. When sugar is low enough so it can be afforded, the bees can be fed instead of putting in the frames of honey as above; or they can be fed at any time when sugar is high if the bee-keeper thinks that sugar is preferable to honey to winter on.

AT WHAT TEMPERATURE DO BEES FLY?

On page 418, 1889, I find these words: "Bees in health seldom go out of their hives unless the temperature of the air runs to about 55." As I can not agree with this, I wish to say a few words on the

subject, as it may lead some one into trouble. All of the older readers of GLEANINGS will doubtless remember the experiment which I tried, of keeping my bee-cellar at about that temperature one winter by the use of an oil-stove, and how all of the bees left their hives during February and March, in many instances, thus causing me the loss of nearly all of them; while both before and since I have been very successful in wintering bees in this same cellar when the temperature ranged from 42 to 45, as it always does when no artificial heat is applied. During the months of November and December, bees are comparatively inactive in this locality, no matter what the temperature may be; but as spring draws on apace, the bees seem to realize it, so that a temperature at which they were quiet in December will not be endured by them later on. For this reason I have frequently seen

a still, cloudy day, and the bees I thought at the time would probably fly as soon as the temperature got at the right point. At 50 none were seen outside; at 52 and 53, only a few; while at 55 there was a pretty general buzzing all over the apiary.

A TEXAS APIARY.

A VIEW OF CALDWELL'S HOME YARD.

FRIEND ROOT:—By way of an explanation of the engraving, I will say that this is my home apiary, and it consists of 200 colonies of Italian bees. Part of the hives are cut off from view by the building, which is the extracting-room. The boy with the wheelbarrow is bringing empty combs to be put on one of the 35 hives on the

A GLIMPSE OF A TEXAS BEE-YARD.

bees bringing pollen at 42 during the month of April, and general work being done later on, with the mercury at from 48 to 50. G. M. DOOLITTLE.

Borodino, N. Y., Nov. 16, 1889.

Well, old friend, you ought to have a medal for that idea of putting a carpet on the wheelbarrow and tacking it so it can not slip. When reading it I felt ashamed to think that I had never before thought of any thing so simple. I agree with you, that two tiers of half-depth frames seem to offer many advantages for winter. When it comes to rearing brood in the spring, however, it seems as if those spaces with a stick above and below were not quite the thing when you want to push brood-rearing. You may be right about the temperature bees fly. My statement was based on an experiment made, I think, in the spring. It was

left side. These are run for extracted honey. The hives on the right are fitted out with T supers, and are run for 1-lb. sections. I have a good home market for all the honey I can produce.

The honey-flow has been poor this season. We get our best honey from white brush, a plant which is valued only for honey. The honey much resembles that from sweet clover. I have several out-apiaries, and can say that I have had but one total failure in the past seven years that I have devoted almost entirely to bee-keeping. J. P. CALDWELL.

San Marcos, Tex., Oct. 10, 1889.

Friend C., we are very much obliged indeed for the beautiful glimpse you give us of your home in the South. The little curly-headed girl a little in the background, between the two lawn hives, especially draws us to the picture. The stout boy with a

Daisy wheelbarrow, carrying two Simplicity hives, in the background, is another pleasant feature. The fellow behind him, still further in the background, has probably been taking his turn at the wheelbarrow, for he seems to be resting. The trees which are scattered among the hives, from their boughs and foliage I should call the eucalyptus, or blue gum, that I saw in California. You did not tell us that it is yourself holding a comb as if you were looking for the queen, but I guess we will take it for granted. The sunlight, as it falls on you through the foliage, at first sight would almost make one think you had been picking blackberries, and had got your shirt torn. We are glad to know that you have been successful in bee culture. We remember your name and your kind words, away back, almost if not quite as long ago as when GLEANINGS first started.

A LITTLE TALK ABOUT BOOKS.

WHAT BOOKS TO READ.

Of making many books there is no end.—ECCLESIASTES 12 : 12.

THE above text seems to have been very literally fulfilled of late years, for a great number of books are written every year, and new books are being published daily. How very different from what it was sixty-five or seventy years ago! Books were not so numerous nor so cheap in those days, and a family who could boast of a library containing a Bible, Testament, Hymn-book, Baxter's Saints' Rest, Call to the Unconverted, Pilgrim's Progress, Æsop's Fables, a few school-books, and perhaps a volume of history or one or two story-books, were considered very rich in literature; were looked up to, and oftentimes envied by their ambitious but less-favored neighbors. To-day, if any one should attempt to enumerate the books of a good, bad, and indifferent character which are being brought into the majority of homes in our land, they would find they had undertaken an herculean task—one impossible to accomplish.

Although it would be impossible to give an extensive list of good books in a short article, it may not come amiss to mention a few interesting ones, and perhaps they may prove helpful to some persons who wish to purchase books for Christmas presents.

"Letters to a Daughter," and "Letters to Elder Daughters," are two excellent books (are small, the two cost \$1.25), by Mrs. Helen Ekin Starrett. They will be welcomed and appreciated by any young girl who desires to become a noble woman, dignified and refined in her manners.

"Six Girls," by Fannie Belle Irving, is an excellent story of home life. It is bright, and full of life; will be enjoyed by any girl, and at the same will teach her useful lessons.

Books by Pansy, Louisa M. Alcott, Mrs. A. D. T. Whitney, the Misses Warner, Miss Mulock, Hesba Stretton, Mrs. Andrew Charles, Mrs. Elizabeth Prentiss, and others of similar character, are healthful in tone, good in sentiment, and enjoyable.

"Stepping Heavenward," by Mrs. Prentiss, has been more widely read, I believe, than any of her other works; and right here let me tell you a little incident concerning it. Some young ladies were one day discussing books by various authors, when one of them remarked in an interrogative way:

"'Stepping Heavenward' is a good book; have you read that, girls?"

"No," said one; "I never read it, but I have heard a great deal about it, and would be glad to read it if I had an opportunity, for I think I should like it."

"Well," said another, "I don't know whether I should like it or not. To tell the truth, I think the name sounds too 'goody-goody'; and I don't like prosy or 'goody-goody' books; they are too insipid. I like good books, but I want them to have a little spice of wickedness in them—just a little, you know, enough to make the characters seem like human beings instead of angels. Now, I am not very good myself; and when I read of these marvelously good people it makes me feel so awfully wicked. Then I'll confess I'm seized with a desire to shake them up and try to make them like ordinary mortals, or else send them off to heaven, where they will find congenial society."

"Well, my dear," laughingly rejoined the first speaker, "if you desire 'congenial society,' some one with 'a spice of wickedness,' you can find it in the heroine of 'Stepping Heavenward.' She had as great a horror of being 'goody-goody' as you have; and when she tried to be good and step heavenward she found it exceedingly hard work. Read it, and see if it is not so. It is an excellent book, and will prove interesting as well as profitable."

A book by Margaret Sydney, "How Tom and Dorothy Made and Kept a Christian Home," is a sweet little story of home life. It tells us how a young couple made a home for themselves, and lived true Christian lives under rather trying circumstances. It is well worth reading by any young person, and might also benefit their elders.

"Ben Hur; a Tale of the Christ," by Gen. Lew Wallace, is so well known that one needs but to say that it gives us an imaginary history of Christ's life on earth; is exceedingly fascinating, seeming to fill out the history given in the Bible, making it more real to our minds, and is a book which can be read and re-read with interest and profit.

"In His Name; a Story of the Waldenses Seven Hundred Years Ago," is a lovely Christmas story. "Ten Times One Is Ten: The Possible Reformation," is a story of reformation. These two books are by Rev. Edward Everett Hale, and are the origin and foundation of the societies known as "The King's Daughters," "The King's Sons," "Lend a Hand," and some others. These books are delightful, and profitable reading for any one.

With Harry Wadsworth's motto—which is the motto of these societies—we must close our little talk.

To look up, and not down;
To look forward, and not back;
To look out, and not in; and
To lend a hand.

Ipava, Ill., Nov. 9, 1889.

ANNA B. QUILLIN.

Many thanks, my good friend, for the suggestions you make in regard to what books to read. I can warmly second what you say about "Stepping Heavenward;"

and I wonder, since you mention it, that we have not had it on our book-list before. —I am glad to know that there is a book published in regard to this organization known as the King's Daughters. There is something inspiring in the very thought; and when we come to know that their work is really in spreading the truths of the gospel, we can not wonder that a blessing seems to follow them. At our noon-day service, we have been in the habit, every Thursday, of repeating texts. For some years text-day seemed to drag a little. Finally a band of King's Daughters was organized among our women-folks, and since then we have had more beautiful texts, sometimes, than our ten minutes will give room for.

WIRED FOUNDATION.

FOUNDATION ON FINE WIRE, CHEESE CLOTH, OR OTHER FABRIC; IS THE IDEA NEW?

I HAVE read in the *American Bee Journal* of wooden comb and its many claims, and this set me to thinking about the wired combs. I thought this: Why not take close, smooth print cloth, or good cheese-cloth, or even the veiling or strong unsized paper, or else fine wire cloth, or any such material, which upon trial may be found suitable, and pass it through the melted wax, the same as the wire cloth is passed through the melted metal to coat it? If one time passing through should not be sufficient to give a suitable coating, pass through the second time, and let it be rolled upon round rollers or drums; then to print or manufacture, run through the machine as the dipped sheets are, then there will be no trouble about combs breaking down, queens hiding in the holes, and running around the ends and the bottoms, for the sheet of foundation can be tacked in tight, full, and straight. What do you think of this? Is it original? Who has tried? Will it do? Why will it not do? Many other questions could be asked.

What do you think of foundation made on fine cloth, put up in rolls of 25 yards, of all widths? If I had a machine, I would not ask so many questions. I feel very confident that there is no reason why it can not be made, and that the bees will not work it out as well as they will any other foundation. If so, then wired frames will be a lost art, broken combs a crime, shipping bees and their combs a certainty that is doubly sure. Try this on some fine close cloth; and if it will do, say so. If any person has tried it, let him arise and say when and where, so that, if there is any good in it, I want the originator to have the praise and the profit. I do not think it will take as much wax to properly coat such cloth as to make the brood-comb foundation, as we use a fine cloth coated with beeswax, and torn into strips about one inch wide for wrapping the buds in when budding the orange-tree; and from this I think there can be no doubt but that such comb foundation can be made, and I will leave it to you and the bee-keepers to test; but if I am the first, I want the credit as the originator, and shall claim the right of a patent if I so think in the future.

JOHN CRAYCRAFT.

Altونا, Lake Co., Fla., Nov. 11, 1889.

Friend C., you are wasting your time and brains in giving any further attention to cloth or other material as foundation as a base for making foundation. Every thing you suggest has been invented again and again. Cheese-cloth or any other kind of cloth will be eventually torn out by the bees. They seem to regard it as some indication that the moth worms are at work. Paper has been used to some extent, but it is open to the same objection. Very fine light wire cloth will do, but it spoils your rolls, and makes your foundation unnecessarily heavy. You can not incorporate any thing of the sort without using a great deal more wax than you use with the ordinary wired frames. No doubt you could get a patent, and very likely it would be worth fully as much as the patents we have already on bee-hives and their fixtures—just nothing at all.

ALFALFA IN MICHIGAN.

VALUABLE POINTERS FROM GEO. E. HILTON.

FOR the past three years I have been trying to get the farmers living on the light sandy land known as "stump lands," and where it seems quite difficult to get the common clovers to catch, to try alfalfa. Two years ago a Mr. Davis, living about four miles from here, sowed a small patch, and it did nicely. Last fall I sent for a bushel of seed, and a friend of mine has sown it. Should this prove a success it will not be long until there will be a large amount sown abroad here; and if it produces honey in Michigan, as friend Ball reports from Nevada, Middle and Northern Michigan is coming to the front as a honey-producing locality. What a wonderful transformation it would be, friend Root, if that waste of land we passed over on that (to me) eventful day between Baldwin and White Cloud could be covered with fields of alfalfa, dotted with happy homes surrounded by herds of cattle and humming bees! Our State officials see the necessity of reclaiming these lands, and now have experimental farms at Baldwin and other places. I am watching closely, and hoping that alfalfa is to be at least one of the agencies to do the work. I shall watch closely this little experiment in which I am directly interested, and report as fast as there is any thing to report, either favorable or otherwise.

WIDTH AND THICKNESS OF TOP-BARS.

I very much dislike to throw a "wet blanket" on any project, but I don't think the heavy-top-bar project will "hold water." About two years ago, T. F. Bingham shipped his entire apiary to me. It now comprises my out-apiary, known as the "Goldenrod Apiary." You are aware, the top-bars are $\frac{1}{4}$ of an inch square; the ends of frames project $\frac{1}{2}$ of an inch above the top-bars; then comes the slatted honey-board, then the clamp of sections, with $\frac{1}{2}$ -inch bottom-bars, bringing the sections $2\frac{1}{4}$ inches from the brood, providing the brood is close to the top-bar, and it usually is, in these shallow frames. Now, if the honey-board could be dispensed with we could get the sections $\frac{3}{4}$ of an inch nearer; but, bless your heart, in 99 cases out of 100 it is built so full of comb that in some cases there are not as many "top-holes" left as one row of

perforated zinc would make. This would make a bad condition of things were the clamp placed where the honey-board now is. They seem to enter the sections just as readily as they do in my hive where the sections are only $\frac{1}{8}$ of an inch from the top-bar, or $\frac{3}{8}$ of an inch from the brood. The matter of distance of sections from brood was brought up at our last State convention, and some of the friends said they had put on three or four honey-boards, and could see no difference in the bees entering the sections. But, all things considered, I prefer having the sections as close to the brood as possible. In my home yard there is but one bee-space, no slatted honey-board, and no burr-combs, and all increase comes under this plan. I think, in Oct. 15th issue of GLEANINGS Prof. Cook spoke of the advocates of chaff hives, clamps, etc., for wintering. He did not get the mode of packing the Bingham hive just right. They are in winter quarters now. If you would like I will have a photograph taken, and send you, with description and manner of manipulating for comb honey.

Fremont, Mich., Nov. 21, 1889. G. E. HILTON.

Friend H., well do I remember that eventful day; and every time I think of it, especially when brought to mind by your earnest work in the Master's service, I can only say, "May the Lord be praised!"—Since you speak of it, I do not see why alfalfa should not thrive on many of the sandy wastes of Northern Michigan. If any of our bee-friends in that section have given it a trial, will they please speak out?

CONVINCING TESTIMONY OF THE VALUE OF BEE-STINGS AS A REMEDY.

HOW THEIR DIRECT APPLICATION CURES INFLAMMATORY RHEUMATISM; BY A COMPETENT
PHYSICIAN.

FRIEND ROOT:—I have seen several statements in GLEANINGS in regard to rheumatism being cured by the sting of bees. I will now give you some of my experience, and a few facts, which have placed *apis mellifica* very high in my estimation as a rheumatic, and also as a kidney and bladder remedy. I give it in many cases for these diseases when indicated.

1. I do not recommend it in *all* cases; but it is worthy of a trial; and if it gives relief it will nearly always effect a cure if continued for some time. As rheumatism is often caused from diseases of the kidneys and bladder, I deem it a favorable sign when the flow of urine is increased, if ever so little, by its use. It matters very little which way it is introduced into the system, just so it gets there. I have used the tincture many years in my general practice, and I should not like to dispense with it. Its use has a broad field in the healing art, and is not confined by any means to the above-mentioned diseases. In the treatment of rheumatism I should rather prefer the direct sting from the bee, if it were possible to apply unbeknown to the patient, which I have succeeded in, in a few instances, for I fear that, to make public the mode of application, would have a tendency to elicit unfavorable comments from the medical fraternity and a criticising public.

In the month of January, about twelve years ago, I was called to the country to see Mr. J. B. I found

him confined to his bed with inflammatory rheumatism. The attack was very severe, considerable swelling and intense pain. Not having any *apis mellifica* in my case, I inquired if they had any bees. I was answered they had, and I requested to be taken to a hive. I procured a number, and returned to my patient. I gave him one sting before he knew what I was doing. He said, "Oh my! Dr. Gress! do you intend killing me?" I assured him it was necessary to give him relief in that way or he would have to continue suffering until I returned to town and procured other remedies. After arguing a few moments I gave him a second pop, and then again a third, fourth, fifth, and I think in all about eight, when he commenced to enter serious objections, so I patiently awaited results, which soon followed in the way of relief of pain, free secretion of urine, and perspiration. I left one hour after, with advice to use the little doctors in the morning. In the afternoon he came to town to see me, and during our conversation he stated he would like to have me make a statement in the paper in regard to the great benefit he had derived. I objected, for reasons before given. But I am frank to admit that I never attended him for any more rheumatism, as the bees were always his doctor in that particular disease.

My second experience was with a negro who applied at the office, suffering with inflammatory rheumatism. I requested him to call at two o'clock, as I had just received a call. While at home at dinner time, I procured some of my cross Italian bees, and on returning to my office I turned them loose in my consultation-room, so I could go in and pick them up as I should require them. I examined the limb, found it swollen and painful. Using his own words he said, "Doctor, if you don't do something for me I shall be compelled to get some one to carry me home. I am growing worse every minute." I told him I would use the medicated needle, as it would act quick. I secured one of my little doctors, hiding it with a piece of tissue paper. I quickly applied it to a sensitive spot. Say's he, "Boss, that needle am pretty sharp," and began to scratch the place, while I went in for another Italian bee. Returning I gave him another pop. He then, wanted to see the needle. Of course, I did not show him what I had used. I then went back to "put some more medicine on the needle," and on my return he exclaimed, "Say, boss, that pain am getting better; but it am smarting just like the sting of a wasp." I made no answer, but kept on applying until I had stung him about ten times. Perspiration now commenced to start, when he got up, stating he was free from pain. He called the next day, stating he gradually grew better, and there was scarcely any swelling left. I have used the tincture of *apis* with almost the same results, although for prompt relief I prefer the "little doctors."

Atchison, Kan., Nov. 20, 1889. P. C. GRESS, M. D.

Well, friends, this begins to look like business in dead earnest, so far as inflammatory rheumatism is concerned. There are enough, I presume, afflicted with this malady to give the matter a complete test in a very short time. If one case of inflammatory rheumatism in ten is cured as promptly as in the above instances, the discovery will be a boon for mankind, without any question. Let the afflicted at once make the trial, and report.

CUCKOO-BEES.

WILL WONDERS IN ENTOMOLOGY NEVER CEASE?

FRIEND ROOT:—I have become very much interested in these cuckoo-bees. I have several communications regarding them, so that it seems to me there can be no mistake in the matter. The longest and most interesting letter is from Mr. E. H. Collins, the intelligent and wide-awake president of the Hamilton Co., Indiana, Bee-keepers' Association. Mr. Collins states that, at their May meeting, the matter was discussed at length. Many complained of a small black bee robbing in their apiaries. It was urged by all, that closing the entrances of the hives did no good. The bees seemed to make no effort to repel the invaders. It was also urged, that the queens could not be at fault, as the colonies were strong, and the hives full of brood; yet the little bees pass into the hives in a stream. Several confirmed these statements, and insisted that these bees were not the common black bees. The association voted that their president investigate the matter. Mr. Collins wrote to me, but, unfortunately, sent none of the bees. You will remember my suggestion, that the intruders were probably our common small black wild bees—*Andrena*—as I had often known of their stealing into hives for honey. You, in an appended remark, suggested that they were robber-bees that appeared small and bald, from the hard usage that they had received. Mr. Collins reported the above to the society at its next meeting, but neither my explanation nor your suggestion seemed to satisfy those most interested. An old experienced bee-keeper, but an uneducated man, said the insect was not new, as he had seen it before, and he was sure it was produced in the hive. He had often seen it come forth from the cell. Mr. Collins also writes that *he is sure that these bees are reared in the hives*. At the August meeting of the Society, held at Oran Maker's, Westfield, Ind., this old gentleman took some of the members to an apiary; and though the bees were flying but little—as the day was cold and unfavorable—still two of the bees were caught. Mr. Collins says he sent these bees to me. I regret to say that they never reached me. It seems that several present at all these meetings were familiar with the bees, and some had hunted for them in the forests, but to no purpose. Mr. Collins says he will promise to send scores to me next summer, or even a whole colony that is infested, if our station wishes to experiment with them.

You see, Mr. Editor, that these are almost certainly the same bees—species of the genus *Apothys*—that Mr. Perry Moore sent me, and which I described in brief in GLEANINGS, current volume, page 811. The specimens sent by Mr. Moore are denuded of their hair, so I can not surely identify the species or send you a good drawing. Just as soon as I can get a perfect specimen I will do both. This is certainly a very interesting discovery; and as several have requested it I will give a more complete account of these bees. These bees are not social, like the honey-bee, bumble-bee, carpenter-bee, and yellow-jackets, but are solitary. Instead of queens, workers, and drones, there are only males and females.

Owing to some peculiarity, perhaps that they are reared in the hive, these bees are permitted to enter the hives as freely as are the rightful owners.

This possibly explains their occupancy of the hives, and their undisturbed ingress and egress. Of course, it would not explain the first entrance; but it is easy to see how a sharp, wide-awake bee might steal in and deposit a score or so of eggs in the cells, even by a colony of Italians or Syrians. It will be remembered, that Sir John Lubbock, in his admirable book, "Bees, Ants, and Wasps," states that, if ants in the pupa state are taken from one colony and given to another, they will be accepted and reared, and then the mature form could be returned to the parent nest with no harm; while if an ant, reared throughout in colony No. 2, were given to colony No. 1, it would be dispatched at once. We all know that young queens just from the cell will be graciously received at all times, if introduced into another colony of bees. Thus we easily believe that the cuckoo-bees, reared in a colony of honey-bees, would be considered as real children of the bee-home, and always welcomed as such.

I do not think these bees have ever been known to "cousin" on the honey-bee before. How serious a matter it will become, will depend wholly upon how numerous they get in a hive. A hundred or so would do no more harm than so many drones, possibly not so much. If they are able to appear in thousands, then it will be quite a different matter. Their winter habits will control this largely. If they pass the winter in the hive with the bees, so that all survive the winter, then we may well be solicitous regarding the future mischief of these bees. I am very desirous to work out the entire problem, and shall be very grateful for specimens, and also for any observations which others may make. A. J. COOK.

Agricultural College, Mich.

And so this insect really used the principle of the diving-bell, with an air-tube reaching above the surface of the water, ages and ages before mankind ever thought of it!

A GLIMPSE AT OMAHA.

A LETTER FROM MRS. JENNIE CULP WILLIAMSON.

DEAR BROTHER:—After a silence of over two years I shall venture to write you a few lines, for my heart and sympathies are still with the bee-brethren of Ohio, even if I am away out here in "Newbraska." I do not know much about that branch of industry here, but the subject is, being talked up. Almost the first call I return I found your A B C, with my home and apiary in it, occupying a prominent place among the young people's books. If you have ever been a stranger in a strange land, you can imagine with what pleasure I greeted it.

It is too bad, Bro. Root, when you were returning from California you did not stop off at the great Gate City of the West, and see how they "run" things here. One of the greatest items of interest to me is the great number of churches; also our Y. M. C. A., with a membership of nearly 1,000 young men.

Our city contains about 24 square miles, and it is astonishing to see the miles of paved streets we have in a city so young, and the rapidity with which we can travel over it from one end to the other with our cable and motor cars. Columbus, O., seemed very tame to me this fall when I was home on a visit. I spent a month at my old home

with the honey-bees, and I am proud to tell you that my son Charlie proves to be a "chip off the old block," for he is running the apiary as successfully, to all appearances, as I did; and I am still more pleased to find he is training up his two little "chips" in the business. Henry, past seven years old, took the smoker last summer, went down into the apiary, opened up a nucleus hive, took out the cards, and found the queen; and Harry (five years old) would amuse himself by playing he was A. I. Root shipping queens. He would take a tin cup, pair of scissors, and an old queen-cage, sit down by a bee-hive, and catch the bees by their wings, clip them, letting them fall into his cup until he had enough to select his queen from, stir them around with his little fingers, seldom getting stung. Now, while I would not allow that to be done a second time after I found it out, it certainly did please me to think I had a little grandson so courageous; and it gives me encouragement to think the children and grandchildren, in all probability, will take care of grandma's bees from this out; but they will remain mine, I think, while I live. They are a source of comfort to me, even if they are 900 miles away. Living in the very heart of the city as we are, I have to deny myself the pleasure of keeping bees.

MRS. JENNIE CULP WILLIAMSON.

Omaha, Neb., Oct. 23, 1889.

We are glad to hear from you, dear friend; but it seems a little sad that you can keep bees no longer. Can't you have a few hives on the roof of the house, even if you are in a city, as friend Muth is? Most people who have once had a real love for the bees will return to the pursuit, sooner or later; and we rather expect to hear that you are keeping bees again, before many years. I should have been exceedingly glad to make a call on you.

A GLIMPSE AT THE FACES OF THE OFFICERS OF THE ASSOCIATION.

A SHORT SKETCH OF THE SECRETARY OF THE
N. A. B. K. A.

IT is with pleasure that I give our readers a view of our energetic and efficient secretary of the North American Beekeepers' Association, Richard Ferdinand Holtermann was born in the city of Hamburg, Germany, June 14, 1860. Two years later, the parents, with their son and two daughters, emigrated to Canada, settling in the county of Renfrew, Ont. Here, at the age of twelve or thirteen, young Holtermann received a portion of his education from a governess. Later he was sent to a private school, and shortly afterward he attended the Ottawa Collegiate Institute at Ottawa. Here his mind wandered, he says, in the direction of boating, cricketing, swimming, etc., rather than toward study. When about fourteen his father moved to Toronto, and then sent his son to the Upper Canada College, and subsequently to Day's Commercial College, where he received the "1 A diploma." He then decided to go on the farm. Shortly afterward he attended the Ontario Agricultural College. Here he graduated with honors, being only 70 marks out of 4000 behind the first medalist. It was in this school, in the capacity of librarian, that

the subject of apiculture was opened up to him through the medium of the A B C and Cook's Manual. The next season was spent as a student with D. A. Jones, in the apiary. He next made the great mistake, he says, of embarking in apiculture a little too soon. The result was, he learned many severe lessons. With his apiary of 79 colonies he underwent the trying ordeal of a bad season to begin with. However, he secured enough alsike honey to enable him to secure the second premium at the Toronto Industrial Exhibition.

R. F. HOLTERMANN.

Later he entered into some speculations, and came out nearly \$1000 in debt; but, unlike a good many young men, he was not discouraged, went to work again, and paid 100 cents on the dollar, instead of trying to get out, as he could have done, by paying a few cents on the dollar. He entered the employ of E. L. Goold & Co., of Brantford, commencing at 85 cents a day, and left as manager of the supply-business, and editor of the *Canadian Honey Producer*. He married, May 17, 1887, Lois, daughter of S. T. Pettit, whom he met at the last meeting of the N. A. B. K. A., held at Rochester, N. Y. They have one son and a daughter; and in their home they seek to have God's will their own. As might be expected, Mr. Holtermann uses neither tobacco nor liquor.

Mr. Holtermann has made bee-keeping pay, and he has averaged, he says, latterly \$8.00 per colony income. He thinks anybody can do as well in a fair locality, providing they start with one or two colonies.

Mr. Holtermann has been active in bee-associations, in which he has held various offices. At the late meeting held in Columbus his name was proposed several times for

the presidency of the association; but he very modestly declined the honor, in favor of another member. His name was next proposed for secretary, and was carried by the unanimous consent of the association.

DR. A. B. MASON, THE MAN FOR SUPERINTENDENT OF THE APIARIAN DEPARTMENT AT THE WORLD'S FAIR IN 1892.

Well, now I have given you a little insight into the life and face of the secretary of the association, I can hardly with propriety omit in this connection the genial face (it's sober in the picture) of the president of the association. We have already given our readers a view of him, accompanied with a biographical sketch; but he is such a large-hearted, good-natured, and almost indispensable member of bee-associations that I feel constrained to introduce him again. He has a happy faculty of making everybody feel well acquainted and *real good* at conventions. Sometimes one of his huge jokes makes some other good friend, at whose expense it was made, feel just a little touchy; but when he begins to know the doctor better, he will always find that the kindest intentions prompted it.

DR. A. B. MASON.

Now, then, while I am about it I want to revive the matter regarding the appointment of a superintendent for the International Bee Exhibit, to be held at the World's Fair in 1892. The suggestion emanates from John Aspinwall, and is a good one. I suggested Dr. Mason, and Prof. Cook seconded the motion; and when the

motion is put to a vote, at the Brantford convention, I hope the doctor will be unanimously elected. From his large experience in the line of preparing exhibits, and his ability to talk down comb-honey slanders, he is *the man*, in my humble judgment.

ERNEST.

BEE-HUNTING IN THE SIERRA NEVA DA MOUNTAINS.

BY A SUCCESSFUL BEE-HUNTER.

BEE-HUNTING always had a fascination for me. In my leisure time I took delight roaming through the woods in search of wild bees, tracking and lining them to their habitation.

I was generally pretty successful in my search, frequently finding three or four trees in a day. I first became interested in bees by reading one of Cooper's novels, entitled "Oak Openings." It described a bee-hunter, his method of operating, lining, and angling for wild bees. I had long known where a swarm of bees came for water near our place. One afternoon, after reading Cooper's plan, I decided to try my luck at bee-hunting. Having arrived at the place, I had all necessary implements ready for business, and soon had quite a line of bees started. I noticed that some of them swerved considerably to one side, owing to a heavy growth of young firs being in their line of flight, while others went directly over them. Having bees working on two combs of honey, I ventured to move one comb, containing perhaps 25 bees, about 100 yards to one side. After filling up they circled around a little, marking the location of the honey, and then took a direct line to a clump of old dead cedars at the bottom of the cañon, where those that had taken a direct line from the first place went. Thinking that the tree must be near where the two intersecting lines met, I gathered up my implements and started down the mountain-side. Arriving at the clump of dead cedars, and making a thorough examination, I soon found the tree. They entered a small knot-hole about 40 feet from the ground. The next thing on the programme was to get the tree down and see what it contained. On going home I returned with axes, wedges, and saw; and after two of us had worked a couple of hours we had the satisfaction of seeing the tree tumble to the ground. It burst open where the bees had constructed their hive, throwing bees, honey, and brood out in wild confusion. We had no difficulty in taking all the honey, and did not receive a single sting. The tree contained upward of a hundred pounds of honey, seventy pounds being beautifully white clear honey. The rest was mixed with bee-bread. I undertook to save the bees, but, not knowing much about them at that time, I made a failure of it.

DIFFERENT PLANS AND METHODS OF BEE-HUNTING.

Cooper's method of bee-hunting is as follows: First get a small light-colored glass or tumbler, transparency being necessary in order to watch the movements of the bee. Find a bee to suit you, and place the glass over it, flower and all, placing your hand underneath to keep the bee from escaping from the bottom. You must have a small empty piece of honey-comb, and some thin honey to pour into the comb, drone comb being best. After obtaining your bees, place your piece of honey-comb on some level surface, and set your bee and glass over the entire comb. Next place your

handkerchief or hat over the glass, making a darkness like that of the hive inside the glass, and then the bee will immediately settle on the comb and commence filling up on the thin honey. While the bee is intently occupied in filling itself, remove the glass and go off to one side, so you can have a better chance to observe the movements of the bee when it commences to circle. The first few circles will denote the direction of the hive, and each succeeding circle will swerve more and more in that direction, until finally, when on the last circle, it will strike off in a direct air-line for its habitation, provided there are no clumps of trees in the way, when it will often swerve to one side, misleading the bee-hunter.

When angling for bees you must move a few hundred yards to either the right or left, and note the direction of their flight. Where the two intersecting lines meet, there will be the hive also. Instead of using the glass, as I used to, I now use a box made as follows: Take two pieces of $\frac{3}{4}$ -inch stuff, 6 inches long and 2 wide; two more pieces, 6 inches long and 4 wide. Use the 6x4 for sides, and the 6x2 for ends; nail together lengthwise. Next, take two pieces, 2 inches long, 2 wide, and $\frac{3}{4}$ thick, and put together thus: **A** Now bore a half-inch hole in the middle, where they come together, and insert it in the under side of the box, something on the principle of Alley's drone and queen trap. Now saw the box in two where this inverted V-shaped piece reaches, and put on a small pair of hinges. Next, nail a piece of wire screen across the top, about 12 meshes to the inch, and you are ready

WATKINS' BEE-HUNTING BOX.

for business. When you want to catch a bee, place the trap down over it, and the bee will immediately go to the top, where the wire screen is. You can venture to catch any number of bees that you want to. Now get your piece of honey-comb; open the trap, and set it in—no danger of the bees escaping, as they are too intent on trying to get out through the wire screen. Close the trap and place a piece of cloth over the screen to darken it, and make the bees settle on the comb. When they are occupied in filling themselves up, open the trap about half way, in order to let the bees that are filling themselves get out. When you have found the course of two or three bees, close the trap and move a few hundred yards further along. By this method you can soon find any bee-tree.

Placerville, Cal.

(To be continued.)

CYCLOPEDIA SCIENCE NOT ALWAYS RELIABLE.

PROF. KOONS HAS SOMETHING FURTHER TO SAY IN REGARD TO APHIDÆ, AS SUGGESTED IN MISS QUILLIN'S LETTER OF NOV. 1.

MISS QUILLIN was unfortunate in two respects, at least, in her selection of authority on aphide, as printed in GLEANINGS for Nov. 1st. In the first place, she went to a very unreliable source, which in this case is about as trustworthy as the statements concerning glucose being extensively fed to bees, as quoted from the American Cyclopædia in GLEANINGS of July 15th. The fact is, that much of the science, so called, in our cyclopædias, is compiled by men who glean from all sources—good, bad, and indifferent, and who are entirely incompetent to judge, either of the accuracy of the statement or the reliability of the source gleaned from; but they conclude that, as they are found in print, the statements must be true.

I am constantly compelled to remind my students that the science found in the general press, the daily, weekly, and monthly periodicals, is very unreliable. As for myself, I never feel safe in accepting a scientific statement unless I get it over the name of a well-recognized authority, or in a book from one of the masters in that special department. Until within comparatively recent years, science was in a very confused state, and, indeed, is still so in many respects, some fact being mingled with much fancy; but out of this "scientific Babel" a more reliable literature is slowly growing.

Webster's Dictionary was found to be so incorrect in many of its cuts and definitions that it is now being revised by a number of specialists. For example, one takes all the chemical words, another all the botanical, another those of a physiological character, and still another the zoological, or architectural, or law, etc., each being a well-recognized authority, and standing high in his profession; and thus we shall soon have a thoroughly reliable book.

Again, besides going to an oft-unreliable source, Miss Q.'s statements, when secured, were not entirely correct; and I am constrained to call attention to it because GLEANINGS, doubtless, is read by many who are interested in hop culture, and consequently in the hop-plant louse. The true history, as recently worked out, is as follows:

The eggs are deposited on the *plum* in the fall by perfect wingless females. In the spring, as the leaves put forth, these hatch into wingless *agamie* females; that is, females that can reproduce without the aid of males; and these bring forth a generation, the *second* wingless like themselves. The third generation, which appears during the early days of June, are *winged* *agamie* females, and these migrate to the *hop*, which by this time is far enough developed to furnish food to the plant lice; and these, after going to the hop, produce the fourth generation, which are again *wingless*, and these in turn produce other wingless forms, and thus on through the summer, generation after generation, till late in August or early in September, when a generation of winged forms, about the twelfth of the year's product, are brought forth. These, too, are *agamie*, as all preceding have been; also at this time all those produced by the surviving members of previous generations, even as far back as the fifth, have *wings*. In other words, all those pro-

duced late in August or early in September, are *agamie winged* females, no matter from what generation they come. Then the very late members of the twelfth generation, late in September, are winged *males*. The winged females, just previously produced, fly away to the plum, and there begin to produce, not agamic, but perfect wingless females, which are full grown by the last of September, when the winged males, above mentioned, fly to the plum, where the perfect wingless females are, and here they mate, and winter eggs are soon deposited about the base of the twigs, and thus provision is made for the same round of life-history the following year. It seems that, if the perfect wingless females of this last generation are deposited upon the hop or any other plant except the *plum*, they will not live, the latter being necessary to their development.

In the life-history as above given, we find an illustration of that wonderful adaptability so often met with in nature. These little creatures have no use for wings in the spring till the *third* generation is produced, and the *hop* is ready to receive them; then after the migration, no further use for them till fall, and it becomes necessary to return to the plum for a late fall, winter, and early spring abode. Nature is not prodigal in her resources, producing only that which is necessary to carry out her designs, giving wings when needed; but when not required, they are not developed. Often it is difficult to interpret those wonderful adaptabilities in nature; but here, at least, we may conjecture why this remarkable life-history. The hop-vines die, and are likely to be removed and burned, or otherwise destroyed—perhaps made into a compost-heap; and if the plant-louse eggs were left upon these, it would be only by mere chance that they would escape destruction; and even if they did escape, the young, when hatched in the spring, would not likely be where they could get suitable food; hence a wise Creator ordained that the winter eggs should be left where destruction would be less likely to overtake them, and where the young would have fresh leaves to feed upon when hatched. Indeed, here, as so often everywhere, the devout student of nature may exclaim, "All thy works are truly and wonderfully made." B. F. KOONS.

Connecticut Agricultural School, Storrs, Ct.

Friend K., we are exceedingly obliged to you for giving us such opportune help in making this complicated matter plain. It has seemed to me a sad thing that our cyclopedias should teach so much error and hearsay. I did not know before that Webster's Dictionary was open to the same charge—at least to any considerable extent. By all means let well-posted, honest men, correct these matters, each in his separate line of work or industry.—In regard to the hop-insect, I want to say to our readers that the hop-growers have been for years almost on the verge of bankruptcy because of the depredations caused by this mischievous little insect. All efforts to combat the foes seemed unavailing, because they came from such mysterious sources at a certain season of the year, and then disappeared as mysteriously as they came. Burning the vines, and every thing of that sort, of course was futile. It did not reach the root of the matter at all. When some professor, I have forgotten his name, first declared that the in-

sect commenced on the wild plum, it seemed to be too wonderful to be true; and the scientific world rejected it as a wild speculation. It is now, however, universally accepted and recognized as true. People who refuse to accept the Dzierzon theory in regard to the natural history of the honey-bee may well be deemed excusable for finding it hard to believe that this hop-insect goes forward for several generations without any males at all. The matter is so complicated, that I confess I never clearly understood it until I read Prof. Koons' explanation as above. The italics are my own. I have taken this liberty, which I am sure the professor will excuse, because I found it so difficult to understand, until I had studied out and decided what words needed to be emphatic.

TREATMENT OF THE INSANE.

A POSTHUMOUS ARTICLE FROM THE PEN OF THE
LATE MRS. MAHALA B. CHADDOCK.

AFTER the death of our correspondent and friend Mrs. Mahala B. Chaddock, we began to hunt around amongst our unused MSS., which, though meritorious of themselves, were, for lack of space at the time, crowded out. We came across the following article, written some time since, and we are glad to give it insertion, as it is a true index of Mrs. Chaddock's real character, and of the philanthropic spirit which actuated her through life. This posthumous production, though exceedingly interesting and valuable in itself, will be read with melancholy interest now.

Editor Gleanings:—

For several years—ever since a friend of mine spent a year at the Jacksonville Insane Asylum—I have been trying to think of some way to help these unfortunate people; but I did not know what to say—that is, what I had better not say. Of the overcrowded condition of the insane-asylums in Illinois, and the wretched treatment that the chronic insane receive at most of our poorhouses, I will not speak, but point out the better way that Wisconsin has cleared out for herself, and which we may all walk in if we are not too bigoted. My information is obtained from the article mentioned, and from pamphlets sent me by A. O. Wright, Secretary of the Wisconsin State Board of Charities and Reforms.

Wisconsin has about 2600 insane, increasing at the rate of about 167 a year. These insane are provided for in the State and city hospitals, and in sixteen county asylums for the chronic insane. The improvements in the care of the insane consist in the doing away with restraints, either by mechanical appliances or by narcotics; separation of the chronic cases from the others; increased liberty, and the substitution of wholesome labor for idleness. These county asylums have been in operation (with two exceptions) for six years. These county asylums are managed by local authorities, but under the constant and close supervision of the State. The buildings are of brick, very plain, solid, and comfortable, and are of a size to accommodate not less than 50 nor more than 100. A farm is needed for economy in maintenance; and to fur-

nish occupation for the men, about four acres for each inhabitant. The fact is recognized, that idleness is no better for an insane than for a sane person. All the outdoor work is done by the men, the housework by the women.

Experience shows that three-fourths of the chronic cases can be furnished occupation of some sort, greatly to their physical and moral good. They are less nervous, and need less restraint when occupied with work, and sometimes a perfect cure is effected. One attendant to every twenty insane persons is sufficient. These asylums are as open as a school; no doors are locked, no bars to the windows, but the glass frames are of iron, painted white; no pens made of boards. The inmates are free to go and come at their work, with no other restraint than the care of the attendant. These asylums are *homes*, not prisons. The great thing is to provide occupation. In the county asylums of Wisconsin, about one person in a thousand is in restraint or seclusion each day. The idea is, that the insane are diseased, and that they need occupation, amusement, and kindness. The practice of this idea has been so successful that it must affect the treatment of the insane all over the country. The secret of providing work is to buy as little material, and hire as little labor, as may be; let the women make the clothes, and the men do the outdoor work without the aid of machinery. Some of these county asylums are almost self-supporting, and all of them save money to the counties, compared with the old method. The State has not lost, and the counties have gained; and the insane in these county asylums have been as well clothed, lodged, and fed, as in the State institutions, and have more freedom and personal comfort, and a better chance for improvement. The new system considers the education of the chronic insane as an important part of the treatment—education of the mental, moral, and physical faculties in habits of order, propriety, and labor. By their means wonders have been worked for the insane.

Now, perhaps you will ask why I write this for GLEANINGS. Because GLEANINGS is a *humanity* paper, and *this is humanity*. Everybody is interested in the treatment of the insane; and then, see! they have a difficulty to find suitable employment for the men in winter time. Then I thought of bee-keeping. Seems to me there could be no more appropriate work than the keeping of bees and raising of honey. How good and how handy the honey would be for the asylum tables! and the men could make the hives, the foundation, the crates, and sections, in winter time. I do not know whether Wisconsin is much of a honey State or not. There are plenty of readers of GLEANINGS who *do* know. I have sent for the names and postoffices of these sixteen county asylums; and whenever you feel like sending out sample copies, you will please remember those poor unfortunates in the Wisconsin county asylums.

Vermont, Ill.

MAHALA B. CHADDOCK.

Although GLEANINGS has had many kind words and many compliments, I do not know that it ever received any thing in that line that is really a *higher* compliment than the expression in the concluding paragraph above: "GLEANINGS is a *humanity* paper;" and I think the readers of GLEANINGS will agree with me in deciding that our departed friend was a *humanity* writer.

Like the rest of us she had her peculiarities and perhaps some eccentricities; but through all her writings there shone out clearly and unmistakably a love for her fellows. There was nothing narrow and contracted in her ideas and teachings. Her sympathies were as broad as the universe; and in the above article her sympathy for this special class of poor afflicted humanity shines forth almost Christ-like. May God be praised, that Wisconsin has set an example before her sister States. The above was written before my visit to Wisconsin, therefore our poor friend did not at the time of writing know what a grand State for bee-keepers Wisconsin is. The idea of interesting the insane in bees is grand. I have for years been well aware that I can, by taking time, interest and enlist the sympathies of almost any individual in the habits of bees. A child, even one of tender years, soon becomes enthusiastic, and so will elderly people. I do not know that I have ever tried the effect on one whose mind was diseased; but I feel quite certain that bees and outside air will accomplish good results if any thing can. Here are a few words from our good friend Mrs. Harrison, who, perhaps, knew Mrs. Chaddock better than almost any one else who reads GLEANINGS.

Dear Mr. Root:

To-day, in sorrow and sadness, I stood beside the finely molded clay, which for nearly forty-six years had been the home of the immortal spirit of Mahala B. Chaddock. Her freed spirit, borne on wings of infinite love, has sought another clime. She, "being dead, yet speaketh." "Be ye therefore ready also; for the Son of man cometh at an hour when ye think not."

MRS. L. HARRISON.

Peoria, Ill., Nov. 14, 1889.

"Being dead, yet speaketh." That is exactly it, dear Mrs. Harrison. Our departed friend's words are yet in print, and before the multitudes, and good is going to come from them. Now, let us as readers of GLEANINGS see what each and every one of us can do to further the grand thought in regard to more intelligent care for the insane. As I read the article my mind moved vividly from one to another in our county infirmary. I thought of their farm, the crops they have raised, their pretty vegetable garden, and the earnestness with which the inmates have delighted to show me their work, and the success of their plans. I am very glad to say that our county infirmary is located on one of the finest farms in the vicinity. It is thoroughly underdrained, and producing good crops. Who knows how soon *we* may need the kind offices of some good Samaritan in just the very line of Mrs. Chaddock's last words to us? We close with a brief letter from her lonely companion.

Mr. Root:—I have sad news for you. My wife, Mrs. M. B. Chaddock, is dead. After a lingering illness of five weeks she departed this life at 8 o'clock P. M., the 12th instant. About the 1st of October she took a severe cold, followed by a remittent form of fever, complicated with other troubles of the body, of long standing. About ten days before her death she had a severe attack of the pleurisy, then a sudden change to pneumonia of the worst type. She suffered much pain and distress of body,

seemingly, though she seldom complained, and thought she would recover, till within a few hours of her death. Myself and family are very sad, and sorely bereaved; and it is hard for me to realize that so valuable a life must be taken from us. Toward the last she seemed unconscious of suffering, and passed quietly away. Funeral service yesterday at 1 o'clock P. M., in the Presbyterian church, Ipava, conducted by Rev. Mr. George, of Lewiston, Ill., after which we laid her to rest in Ipava cemetery.

JOHN CHADDOCK.

Vermont, Ill., Nov. 15, 1889.

Dear brother, our sympathies and our prayers are with you. May Christ Jesus sustain and comfort you in this your great affliction; and may you, too, be cheered by the beautiful but brief little text given us by our friend Mrs. Harrison: She "being dead, yet sleepeth."

THE ALFALFA OF ARIZONA.

AN UNFAILING SOURCE OF HONEY; MANNER OF IRRIGATING.

DEAR FRIEND ROOT:—To think of *you* paying us a visit! well, well! Your brother and I have often talked about the matter, and wondered if we could not in some way (now that the ice is broken, and you have made a visit to California) induce you to pay us a visit here in this incomparable country, a paradise for bees and fruits. It is the great sanitarium for all lung diseases, and the most healthful climate it has ever been my lot to experience, though I have lived in several States said to have the healthiest. This is a land whose bright sunshine is far ahead of any thing else in these United States, and whose moonshine surpasses even that of far-famed Italy.

You ask if we get large yields of honey every season. Yes. We have never had what you would call a poor season; but this season has been a poor one for us. The mesquite was almost a failure here, and that is our finest honey, it being as clear as water, and very fine flavored. When granulated, it is as white as butter. Alfalfa is not quite clear, but is what is commonly called white honey; but it is clear enough so that you can see a pin at the bottom of a gallon bucket, and that is clear enough for any purpose. Alfalfa honey is a certainty every season; and right here I will say we have never before had any thing like the army-worm. It was not really a grasshopper, though we called them grasshoppers. They were a very small beetle, or bug, that could hop somewhat less than a flea, and lived entirely on the alfalfa bloom during one crop; and when the crop was cut we saw no more of them.

When we run our alfalfa fields for hay alone we cut it six times. Last year I made four hay crops and one seed crop; this season I made one hay crop and two seed crops, without irrigation.

We usually irrigate every time we cut the crop off, which I think is unnecessary. I think we could make just as much to make two crops and irrigate, though some people think the ground must be flooded every time. I have seen some irrigate twice for every cutting.

To irrigate the ground there are two ways practiced here, quite similar in some respects, owing to the length of the lands. If the lands are more than 220 yards in length we make ditches every 20 yards, the full length of the field, and turn the water on

at the upper end of the land. When it is flooded for about 100 yards we put the greater part of the water in the first ditch and make a tappoon, or dam, and turn it out on the land at the point where the water has run to on the land; and when it has run another 100 yards on the land we make another tappoon in the ditch just where the water on the land has got to, and break or take out the dam above, and let the water come down and go on the land at that point, and so on till that land is irrigated; then we go up to the head and turn the water to the next land, and shut it off the first. I send a diagram, showing a field laid off for irrigation.

When the lands are short we simply throw up high strong borders every 10 yards, and then all we have to do is to turn the water on at the upper end and let it run till it floods the whole land, then turn it on the next, and so on till the whole piece is irrigated.

Land set to alfalfa is valued at \$100 per acre, because it will pay the interest and taxes on that amount. Alfalfa does not bloom in our winter sufficiently to do much good as bee pasturage. We have not tested sufficiently to answer your last question.

JNO. L. GREGG.

Tempe, Arizona, Nov. 15, 1889.

ALFALFA AS A HONEY-PLANT.

SOME IMPORTANT SUGGESTIONS FROM THE ALFALFA FIELDS OF KANSAS.

MR. ROOT:—About a year ago, while preaching in Hiawatha, Kan., I became acquainted with Judge Dickinson, who is a lover of bees, and a warm admirer of GLEANINGS; and through him I became a subscriber and reader of your journal. While I am not a beekeeper, yet I have always had a strong desire in that direction, but have never just seen my way clear to embark in the business. In the last issue of GLEANINGS I saw an article from Arizona, headed "Alfalfa and Bees," which dealt with a subject I have been interested in for some time. I have often asked, "Can bees make honey from alfalfa?" but never happened to ask any one who knew. If alfalfa is good for bees to work on, and can make good honey from it, then indeed in this Southwestern country we must have the best territory for bees there is in the United States; yet in the whole of Southwestern Kansas I do not know of a stand of bees. Here in the vicinity of Garden City we irrigate, having now adjacent to Garden City fully three hundred thousand acres under a most perfect system of irrigation; and this vast territory is fast becoming an alfalfa field. We now have in Finney County several thousand acres in alfalfa, and fully as much more will be sown in the spring.

Over ten thousand bushels of alfalfa seed will be shipped from Garden City this year. Now, this clover (as it is sometimes called) is in bloom from May 10th until in November. We always cut four crops of hay per year from it, and quite frequently five, depending entirely as to whether we have an early or late spring. From the time we cut the first crop in the spring until winter comes on, our alfalfa is ready to cut every thirty days, and we get from seven to ten tons per acre during the season. Unlike red clover, alfalfa, when once set, is good for all time. So long as we irrigated it, it became thicker every year; and if a person were handling bees there would be no trouble in having a continuous bloom from them from May 10th until in November, which, it seems to me, would certainly pay well.

From those who have experience, I hope we shall hear more through your excellent paper, as to the quality of honey and the amount that can be made from alfalfa bloom; and if it is profitable, we shall hope for some one who has had experience in the business to bring some bees here and utilize the sweetness we are each year wasting.

In Finney County we have alfalfa fields ranging from 50 to 350 acres. The hay is used to feed stock. Alfalfa hay will fatten cattle about as well as corn, and is much cheaper, and requires less work than corn, even in the best corn countries. We winter our hogs on alfalfa hay and water. They will eat it as well as cattle will eat timothy hay, and keep in good stock shape on it. We can run ten head of hogs per acre on green alfalfa, and make nine-months-old pigs weigh from 200 to 225 pounds. Many of our farmers are using their whole farms in alfalfa and hogs, cutting only enough hay to winter the brood sows. While in all these ways alfalfa can be used, yet the part the bees utilize goes to waste. Let us have some apiaries here. Good alfalfa land under irrigation is cheap—can be purchased from \$6 25 to \$12.00 per acre, owing to location. Alfalfa seed is worth \$3.00 per bushel. One bushel of seed will sow three acres. It costs from \$1.00 to \$1.25 per acre to irrigate during the whole season, so that, at a cost of about \$1800, 160 acres could be set in alfalfa for bees, and at much less expense, if the party does his own plowing and sowing; or if the party does not desire to purchase land and go into the alfalfa business, let him bring his bees to gather the honey from the alfalfa already growing. Surely no one will object.

Now, Mr. Editor, I hope you will excuse me for having introduced myself to you in such a long article; but I felt like writing this much, for I am interested in this subject; and if you consider this worthy a place in your paper, I shall be pleased.

Permit me to say, I am wonderfully well pleased with your publication, both for the many useful suggestions it gives—the general information with which it abounds, and especially am I well pleased with its high moral tone. A. C. McKEEVER.

Garden City, Kan., Nov. 16, 1889.

Friend M., we are very glad indeed to get the facts you furnish us. It is going to be a pretty hard matter for me to make a trip to Arizona, at least very soon. But I could skip down to *your* locality with but comparatively little trouble. The first thing, however, is to find some live bee-keeper in *your* vicinity, and have him give this matter a careful test. Come, friends, ye who hail

from the locality mentioned, stand up and tell us what you know about it. During my trip to California I was constantly on the lookout for alfalfa. Perhaps it was not the right time of year. For some reason I have never yet seen one solid field of alfalfa of even 25 acres. If so, I did not know it.

“OUR HOMES.”

AN INTERESTING ARTICLE FROM THE PEN OF T. B. TERRY, WHICH EVERY FATHER AND MOTHER SHOULD READ.

FRIEND ROOT:—Our minister called on us last Sunday for aid to establish a good reading-room for the boys and young men who hang around town nights. He didn't put it in just those words, but that is the truth of it; it is for the idle young men who hang around the stores and saloons evenings. This matter has been running in my mind all the week. It has seemed to me that prevention would be a thousand times better than the cure in this case. There should be no call for a young men's reading-room in a little town the size of this, where almost every one is comfortably well off. There should be no occasion to fix up a pleasant room to try to draw the boys in and keep them from the saloons and other such places.

How should we manage to prevent it? Why, in the first place by making home the brightest and most cheerful place possible, and providing good books and papers suitable for the boys and young men as well as the older people. I think we ought to study to do this, and to encourage the young folks to have their mates visit them and have a good time at their own homes. Then I would, from the very beginning, *never* allow a boy to run around town nights. Pray tell me why he should any more than his sister? No decent girls ever hang around the saloons and shops and stores. Such a thing is never thought of. Wouldn't we have thought our minister crazy if he had wanted help to fit up a reading-room for *girls*? Is a boy any better able to stand temptation than a girl?

It is beyond a doubt a duty required of us parents to keep our boys at home nights; but it is hard to do this, entirely against their wills; therefore as a help I would make home pleasant—so pleasant that it would require but very slight authority to keep them there—often, perhaps, none at all. I remember once visiting at a farmhouse where the mother expressed much anxiety because her only son went to town nearly every night. They were moderately well-to-do farmers. But I could hardly blame that bright son for wanting to get away from the place where he ate and slept. Wasn't it a good house? Oh, yes! quite good, and well furnished; but it was wretchedly warmed and lighted, and there wasn't a book or a paper that any boy would care to look at. They cut their wood each day, from hand to mouth; lived around the cook-stove, mostly, and had one poor little lamp burning that hardly gave more light than a candle. This particular case interested me a good deal. I remarked to the mother: “That is a nice new carpet you have in your best room.”

“Oh, no!” she said; “we have had that twenty years!”

Do you know what thoughts came to my mind?

Why, that those parents cared more for their carpets and furniture, and wood and oil and money, than for that only son—at least their actions seemed to make it appear so to an outsider. Now, in contrast, go up to the "Center" with me and see the brilliantly lighted saloons and billiard-rooms where all is warm and comfortable. Were they as stingy with their lights and fires and other comforts as some parents are, how much of a crowd would they draw? Our saloons and other bad places where boys congregate at night do not seem to love darkness better than light, even if their deeds are evil. Or, if they do love it better, they know what will draw in a crowd, and they work from policy. Why should not all of us who have boys or hired men work as persistently to save them as the enemy does to entice them away? Now, these parents spoken of above were plain, simple people, who started with nothing, and thus got in the habit of being very economical, and they failed to see that their son and hired man and daughters were not being cared for any better than so many head of cattle. Why, I just ached to go and buy a big hanging lamp for their best room, and a larger heating stove, and \$25.00 worth of good papers, magazines, books, and games, and tell these young people: "Now have a good time; invite in your mates, and enjoy daily the best we have got." I couldn't possibly sit still and see my children go to the bad, and talk about what a "trial and affliction" they were to me.

In our own family we never attempt to economize in either lights or fuel. We have three large rooms opening together with double doors, and a large hanging lamp in each one, and one large base-burner heats them all. We usually use all these rooms—the best in the house. The lamp in one room, particularly for reading, gives a light, it is said, equal to 80 candles. I know it is brighter than ordinary daylight. We burn about two gallons of oil per week, at this season of the year. Bought by the barrel, this costs about 20 cents. Rather than try to save by burning less lamps, I would wear my old overcoat another winter; but there are very few people who can not afford this much oil. What is \$5.00 by the side of a brilliantly lighted house all winter? You might call us extravagant in the amount of fuel used. We bought seven tons of anthracite coal for our big heating stove this winter, at a cost of \$5.40 a ton. Well, think a moment. Aside from a pleasanter home, think of how much less danger there is that the health of my wife and daughters will be injured, where the whole house is warmed up. Plenty of pure air is essential to the best health. When I see a whole family sitting in one ordinary-sized room, I can not help but think that the doctor may take more than they save on fuel.

The season is now at hand when our homes need the most lighting and heating. May your readers think over these things; and if there be any truth in what has been said, act accordingly. Now is the time, also, for getting a supply of books and papers for the year. Wife and I visited our friend John Gould the other day. I want to tell you one thing that "John" has done that calls for our highest praise. When he was married, some ten years ago, he was in the habit of using tobacco. I suspect his wife didn't like it; but be that as it may, John figured up what his cigars, etc., had cost him per year, and found it was about \$35. Then he said: "No

more tobacco for me hereafter; but I will each year spend this \$35.00 for new books." He has done so, and now has a \$350 library. He is proud of it, as he should be. How much better than to have used up the money in *worse*, than useless smoking and chewing! How many young men who read GLEANINGS will go and do likewise?

To the older ones: When you are getting your papers and books for the year, get some paper like *The Youth's Companion* for the young folks, and also some good story-books such as the children like. Remember what you liked to read when you were young. I think I may safely say, that not one farmer's family in ten takes any paper or magazine, or buys any books *especially* for the young people. T. B. TERRY.

Hudson, O.

Friend T., while I do not like to throw cold water on any project for reaching our boys, I must say that I have had just about the same feeling, for a good many years, that you have. The matter of a reading-room for young men has come up a good many times here in Medina. In fact, it usually comes up after each of our revivals; but I confess that it has seemed to me, especially in a town of our size, as if it were hardly just what *we* need. To make a success, a room should be procured in the busy part of the town. It ought also to be of convenient access to the street; then it must not only be warmed and lighted, but somebody must be on hand to look after it; if not, it will soon go to ruin. All of these things are expensive; but even after the expense has been incurred they are apt to be deserted. I visited many reading-rooms in California; and as a rule the papers and magazines were old and out of date because somebody had carried off the late ones, and there was a good deal of disorder besides. At one time in our town they had the money raised, and were almost ready to start, when so much disagreement arose in regard to the character of the amusements to be brought in that it fell through. In fact, a considerable class of people insisted that the boys should be allowed to smoke cigars in the reading-room. Others thought that a smoking-room adjoining would be the thing. Now, where in the world is a better place to settle all such perplexing matters than in the boy's own home? If the father and mother, and brothers and sisters, can not settle it amicably, who else shall do so? In regard to making a home pleasant, my late hobbies have been, as you know, plenty of pure air and pure water; and as my eyes begin to fail, I am just ready to second with a loud amen your remarks in regard to plenty of light during these long evenings. And when we begin to get old enough to feel twinges of rheumatism, we surely ought to be ready to second your suggestions about good-sized rooms well warmed. In towns and cities large enough to make it worth while to support a reading-room, I would by no means object; but in the majority of cases I think our homes are the places to have our reading-rooms. Let the boys and girls read together; let them invite in their friends; for what shall it profit a man if he gain the whole world and lose his own soul?

or, if you please, lose the soul or the affection, and influence over his sons and daughters? There is not a father or a mother anywhere but that has a true love and regard for their children; but, alas! they often wait until it is too late. Now, then, dear friends, shall we not go to work and fix up these reading-rooms, or, rather, fix up the rooms we live in? Go without almost anything else rather than to scrimp or discourage the children; and by all manner of means chop off the tobacco whenever it in any sense stands in the way of a \$350 library. May the Lord bless our good friend John Gould for the example he has set us. Perhaps he has told us of it himself in his writings in the *Ohio Farmer*; but if so, I have never noticed it. Who is there among our readers who will stand by him in giving up tobacco for the sake of a good library? Come, now, let's see you stand up and give us your promise through the Tobacco Column.

MOVING BEES.

THEODORE O. PEET TELLS HOW HE DID IT.

IN reading our text-books, we are told it is almost impossible to move bees less than a mile away from their old stands. As I had occasion to move mine this spring only about two hundred yards, I was at first a little puzzled as to how I should do it. But "necessity is the mother of invention;" and as I possess some little genius, I set myself to thinking out how I should do it, and with the following result.

A year ago last spring I moved from Arlington, N. J. (which is a small country town adjacent to Newark, and only about one hour's ride from my business in New York), to Brooklyn, N. Y. I had two very nice swarms of bees which I desired to keep possession of; and as I could not take them with me to the city, I obtained permission from a neighbor, who kept a number of swarms, to place mine in her yard. During the spring they swarmed, and either went away or were gathered by my neighbor, thinking they were hers. I did not care particularly about this, as I only wanted to keep my two colonies intact till I was ready to take them again myself. This last spring I moved back again to Arlington, and so wanted my bees back again. My new home is only about two hundred yards away from my neighbor's, as I told you before; but I wanted my bees close by where I could look after them with as little trouble as possible, as I have very little time now after business, my whole time belonging to my employers.

On examining the colonies, I found one of them was queenless; the other one was in good condition, the queen laying rapidly. I immediately sent to a queen-breeder and obtained two queens. The extra one was to start a colony for my next-door neighbor, who had at one time kept some, but had lost them. As soon as the queens arrived, I took the queenless colony and divided it, giving each queen two combs, and the bees that were clinging to them, together with a comb of brood from the colony that was all right. I put one of them in my neighbor's attic, and the other one in my own attic, arranging to let the bees fly out of the window. As soon as I took this colony away from the

yard, I moved the other colony (which stood about three feet from the one removed) about where the space was between the two. This I did to catch any bees that might wander back to the old spot. It worked admirably, and I lost very few; in fact, I think none were lost entirely. I kept robbing the old colony, with the laying queen, of hatching bees, replacing with empty combs till the two new colonies were thoroughly established, which soon came about. Now, the question, "How should I get the other one home?" arose, and this is the way I did it: I just picked it up and carried it, hive and all, and set it in my yard. I then took a shipping-box that held four frames, and put two frames of empty combs in it, and set it on the old stand. The next night, after dark, I went and got it, brought it home, found a couple of handfuls, or, say, about a pint, of bees, clustered on the two combs. These I quietly slipped into the old hive, and took the box back again with one frame of comb in. The next night I went after this, and found only half a dozen bees in it. I concluded I had moved them successfully, and did not set my trap again. All these are doing well now. I did not get any honey, but that was on account of the almost incessant rains during the season of bloom, and not the fault of the bees or moving them.

THEO. O. PEET.

Arlington, Hudson Co., N. J., Nov. 19.

Friend P., if you take a queenless colony, or one that has been some time queenless, and give them a queen, or, if you choose, divide them and give each half a queen, they will be pretty much in the condition of a new swarm, and they will stick by their new queen, no matter where you put them. In the other case, where a pint of bees went back to the old locality, you had about the same success that we do as a rule. I think, however, that perhaps as many more scattered about and went into other hives. I am surprised, however, to find that a second night you found only a few bees. Most of my experience resulted in finding just as many the second night, the third, and so on; and I decided that

A bee removed against his will
Is of the same opinion still,—

unless you give them a new queen, or bring some unusual influence to bear to make them adhere to a new location.

EXTRACTORS REVOLVING FOUR OR MORE COMBS AT ONE TIME, ETC.

OUR FRIEND J. F. M'INTYRE GIVES US SOME IMPORTANT FACTS.

IF our readers will turn to page 842, Nov. 1, they will be able to read the following more understandingly:

M'INTYRE'S REVERSIBLE EXTRACTOR VERSUS THE TWO-FRAME NOVICE.

Friend Root:—GLEANINGS is just received. The extractor cut is very fine, and shows the reversing gear correctly. The only fault I can find is, that it doesn't show the chains that keep the baskets from swinging out too far, and the tin braces that support the wire cloth in the baskets. With regard to your editorial comments, I suppose the inside gear of my extractor will weigh four times as much as one of yours, yet my wife (who is not very strong and weighs only 110 pounds) says she will take hon-

ey out of the combs, uncap and extract, against any of your experts, he to use a two-comb Novice. I weigh 170 pounds, and can uncap and extract from 250 to 300 pounds per hour, according to the amount of uncapping to be done, and the thickness of the honey. I should like to know how much one of your experts can extract in an hour with a two-comb Novice. When I came to California, Mr. Wilkin was running this apiary with two Novice extractors and four assistants. I run it now with one assistant, and extract as much honey per day as he did with four. After a vast amount of experimenting, I find the best thing to prevent combs from breaking in any extractor is to put only eight combs in a ten-frame super. The reason why so many break is because, in uncapping, the comb is cut down to or below the level of the frame. If the comb is $\frac{1}{4}$ inch thicker than the frame after the capping is off it will seldom break. It is no more trouble to put combs in a reversible extractor if the baskets stand with the side toward you; and as they do not come out until empty, it is less trouble to take them out. Non reversible extractors have not been handled by dealers in this county for several years. J. F. MCINTYRE.

Fillmore, Cal., Nov. 11, 1889.

Very good, friend M. Such facts as you give from actual work are exactly what we want; and even if they do upset and controvert the opinion I expressed, we are all the more glad to get them. From the above it would seem that I am entirely mistaken. But before I give up I should be glad to hear from others who have used extractors swinging four or more combs at once. Perhaps I may say to the readers of GLEANINGS, that Mr. McIntyre is a remarkably bright, keen, young Canadian. His grounds, tools, and manner of working, reminded me vividly of friend Terry. Almost every bee-keeper has his notions in regard to implements and ways of working. I am somewhat surprised to find that a rather small woman like Mrs. McIntyre should succeed so well; but if anybody could take from 250 to 300 lbs. an hour with any extractor, I should think likely friend M. would be the man to do it. When they were soldering up their cans for honey, in order to fill a large shipment to go to Europe, you may remember that I told you that he in a very little time soldered more cans than an experienced tinsmith. If nobody comes to my aid, I will own up that I was mistaken. I am very glad of the point made, that heavy combs are broken by slicing off too much with the cappings. Since you mention it, I remember the same thing. Hurrah! here is a letter already, pretty nearly in a line with my position.

A REPORT FROM ONE WHO HAS USED THE STANLEY AND NOVICE EXTRACTORS.

In GLEANINGS for Nov. 1 you ask for a report of those who have had and used the Stanley reversing extractor. I have used one two years; and now that I have the Novice extractor, which I got of you, I do not expect to use Stanley's much, if any more, as we prefer to use yours. My extracting man calls the Stanley a "man-killer," as it requires so much more strength to operate it. If I were buying new, I would take the Novice, even at the same price (mine cost less than one-half, every

time. I have extracted from 150 hives, and know what I am writing about. O. R. COE.

Prattville, N. Y., Nov. 11, 1889.

CLOSED-END OR STANDING FRAMES.

IMPROVEMENTS IN FRAMES, HIVES, ETC.

NOW, then, Mr. Root, as you have evidently, from your own articles, and also from the contributions of others, published in GLEANINGS of late, been thinking that closed-end, or standing frames, have advantages, and are sought for, and actually in use by many successful bee-keepers (I don't include myself), I hope you will still continue the good work, and shortly give us another improved hive containing this principle in some form or other. I also hope that Mr. Vandeusen, Mr. Hetherington, Hawk, and many others, while giving their views, will mention particularly the difference of bees wintering in closed-end frames that fit closely to the end of hives, and those in standing frames having a space between the end of the hive and the frames, as with the ordinary hanging frame, as this is an important matter to bee-keepers in the northern part of North America (Canada is not yet in the United States, but may be about the time the international is held in Brantford).

As for myself, I have used several styles of hives with hanging frames since I first commenced bee-keeping, in 1863, and have still to-day one of the ten-frame Langstroth observing hives, made that year, in my apiary. I may also add, although somewhat foreign to the subject, that I purchased from father Langstroth, and successfully introduced an Italian queen to a colony of black bees, in the hive referred to, 25 years ago. But, to resume.

I finally settled, several years ago, on the eight-frame L. hive, without bevels, having a plain flat board, cleated at the ends, for a cover, with a full bee-space above the frames, the bottom-board being loose, and having a $\frac{3}{8}$ space on its upper surface for entrance, etc.

This hive, you will observe, is similar to your Dovetailed hive, and also very much resembles the old-style Heddon-Langstroth. Well, I liked it for all purposes, and still do so; but I wish something better, if it can be had; and thinking the closed-end frames had advantages not possessed by any other, you can not wonder that I lost no time in securing 25 of the new Heddon hives as soon as they were manufactured in Canada.

Without further reference to this hive at present, I will explain that I have entertained the hope of soon establishing an out-apiary, and, therefore, have the desire for some readily movable hive, and one that can easily be prepared for moving speedily and safely from one location to another; and while wishing to make this change, aside from the mere "fun of the thing" I wish also that it be done with as little expense as is consistent with securing the end in view. I am not prepared by any means to discard all my stock on hand, nor do I think it necessary to do so; still, I am well aware, that, the deeper the frame, the greater will be the difficulty in securing an easily manipulated frame, especially of this description, as I prefer them spaced $1\frac{1}{8}$ inches from center to center. I also am in favor of a reversible frame independently of the pleasure of having the comb securely attached to both top and

bottom bars; but whether or not it should be handled by the single frame or by the hiveful, depends on circumstances and the system followed out by the operator.

Now, Mr. Editor, by all means give us a closed-end or standing reversible frame and one suited to your Dovetailed hive as you now make them. There need be no unnecessary confusion in this respect, as all the purchaser needs to do is to state the kind of frame preferred in the brood-chamber. For myself I see no reason why the Vandeußen metal corner would not work well. It certainly will kill fewer bees than any thing else I know of; but whether the metal corners and the ordinary $\frac{3}{4}$ -wide frame, having the space between the end of the frames and the end of the hive is not as good for wintering and springing the bees as the closed-end all-wood ones, coming close to the end of the hive, I know not. This feature is certainly worth considering, apart from the propolis question, which, in this locality, is a very great nuisance in any kind of hive, and much more so in one not very accurately made.

In conclusion, I am glad you are going to make white-poplar sections, and all in one piece too; but if you can not do so without having the naughty corner on them, then by all means make them dovetailed. I have used the T super, and also the half-story wide-frame case with separators, and I am considerably taken up with your topless section-holders also, although I have not yet tried them.

F. A. GEMMILL.

Stratford, Ont., Can.

Thanks, friend G., for your suggestions. We have been doing, for a year back, just what you express the hope that we would do—that is, working toward closed-end, or, rather, frames standing at fixed distances, the same adapted to the Dovetailed hive. In the article in our issue for June 15 a hint was thrown out on page 514 by your humble servant, that we might in time work into the Vandeußen frames, and the idea is now beginning to materialize. From scores of letters—most of them unpublished—it is pretty evident that there is a demand for a frame that will be suitable for moving to out-apiaries, adapted to shipping, capable of being reversed, and one which will secure nearly all the advantages of a suspended frame. This frame, as nearly as I can so far see, seems to be the Hetherington-Vandeußen. A great many inquiries have come in, in regard to it since the initial article in the issue for June 15. In a private letter received from friend Hawk he states that he received likewise a great many letters concerning them. I may say, for the benefit of those who desire to test them on a small scale, that we shall put them on the market soon. I have just been through some experiences in removing bees to and from out-apiaries, and carrying them into the cellar. If I ever appreciated the advantages of a frame that would not shuck about, come off from its bearings when the hive was tilted a little bit out of level, or subjected to an unexpected bump or jar, I appreciate it now. Let me say right here, that I do not wish anybody to invest very largely in these frames when they come before the public. Test them on a small scale yourself; and if you do not like them you

will not have been to any very great expense. If you do like them, you will know what to do, of course.

ERNEST.

REPORTS ENCOURAGING.

ENCOURAGING FOR AUSTRALIA.

We are going to have a real booming season this year. Although the honey season has only just commenced in most parts, I have already extracted over 4000 lbs. of honey; and as there are about 6 months yet before the close, things look very promising. I shall very probably send you a report at the end of the season. I have now 150 hives of Italian bees. I have steam-power, and one of your \$30.00 saw-tables, for making hives, etc. I do a good trade in foundation, and supplies generally, and am 23 years of age, so I am progressing nicely.

I am mailing you a small lump of wax produced by our small black stingless bees. If you are any way interested I shall tell you more about them in the future.

H. L. JONES.

Goodna, Queensland, Aus., Sept. 26, 1889.

RED-CLOVER ITALIAN QUEENS, CARNIOLANS, ETC.

The fore part of the season was very poor for bees. They swarmed very little this year. Honey is scarce; but since August the bees have done well, and are in a good condition for winter. I have 26 stands at present. The three queens you sent to me last August are good red-clover queens. I received $4\frac{1}{2}$ lbs. of bees and two queens from J. Nebel & Sons, High Hill, Mo., the 6th of June, and they are red-clover queens. I have five stands of them, and they have gathered 675 lbs. of honey this poor season. I think they have done well. The blacks have done nothing here for me this season. I have two stands of Carniolan bees. I got the queen from S. W. Morrison. They are gentle, and good workers. My bees worked well on Japanese buckwheat, and I raised a nice lot of spider-plant seed. I think it yields more honey than any thing I have seen in this locality. I am giving the seed away to my neighbors.

T. OBERHITNER.

Deshler, O., Oct. 7, 1889.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

MARKETING HONEY ON THE STREETS.

This has been a poor season here for bees. I am the only one that got any honey here this year. I had 500 lbs. from 12 hives, most of it extracted. I am selling it in yeast-powder bottles holding 9 oz., for 15 cts. a bottle, or two for 25 cts., or \$1.20 a dozen, wholesale. I stand on the market once a week. I have no trouble to sell it, because it is good honey. I generally sell about 7 dozen bottles in half a day. I go to market to-night with one of our truckers to Wilmington, Del., 15 miles. We start about one o'clock to-night. I bought five Carniolan queens this fall, and lost them all by introducing by a new plan given by the shipper. I wanted to give the Carniolan bees a trial next year, but will give it up, as I am a poor man and can not buy more.

S. M. HICKERS.

Delaware City, Del., Oct. 15, 1889.

THE COMPOSITION OF ROYAL JELLY.

I see it has been said in one of the back numbers of GLEANINGS, that royal jelly is but an accumulation of chyme, such as is fed to ordinary young brood. Inclosed I send you some information, from the English *Daily News*, that may throw some light on this interesting subject. This seems to support Mr. F. Cheshire's remark in "Bees and Bee-keeping," Vol. I., page 83; namely, that the "food fed to the very young grubs is extremely rich in nitrogenous substances, and this alone is the secret of the future development of the grub." It would be interesting to know if the experiment has been tried, of injecting, by means of a minute glass syringe, the further allowance of fully digested or young-brood food at the right time, so as to cause the queen to develop artificially, as it were. This would prove once for all in a most unmistakable manner how a queen is produced, and possibly start a new era in the queen-rearing business.

Nashville, Ore., Nov. 18, 1889.

J. T. SIBREE.

The clipping referred to is as follows:

One of the strangest facts in the social economy of a bee-hive is the way in which the development of the larvæ is directed by the workers. If the queen is removed, a new sovereign is promptly raised by the simple expedient of enlarging the cell and altering the food of a working larva. The food supplied to the grubs has now been carefully studied by Herr A. von Planta, whose results are extremely curious. The larval queen, he says, is fed during the whole of her time on fully digested material very rich in nitrogenous substances. Those which are to turn into drones are supplied for the first four days of their existence with a similar diet, but one which is even richer in nitrogen, and for the rest of the time this digested food is diluted by the addition of pollen grains and honey. The worker grubs are treated in much the same way. They receive for the first four days a food intermediate in composition between that of a queen and that for a drone. Then comes a change, and the food is diluted with a large quantity of honey without any admixture of pollen. This alteration is the determining point in the life-history of the insect; for if, at the fourth day, the cell is enlarged and queen food supplied, a queen will result; but if once the inferior diet has been begun it is impossible or very difficult to effect the change.

THE JAPANESE BEATS EVERY THING; A SPLENDID REPORT.

If you wish to know how the Japanese buckwheat has done, I would say it gave good satisfaction to all parties concerned. It was ordered for four different men, 2 pecks each. One man hasn't told me yet how much he raised from his, but he says it is the best in the world. He sowed half a bushel of silverhull buckwheat alongside of the Japanese. It wasn't worth any thing; and the report of the old buckwheat, so far as I have heard, is about the same in substance. The man who hasn't told how much he raised, took 1½ bushels to the mill on the 16th inst., and got it ground, and had 53 lbs. of flour. The 1½ bushels that were sown on my own farm yielded 69 bushels. I came pretty near having to buy a new mill to clean the Japanese on. It took an extra hand to rub it through the fine riddle, and even then some grains wouldn't go through. The Japanese buckwheat made a splendid yield in grain, a big turnout of flour, and good griddle cakes; but it bloomed so nice, and smelled so good, that nearly all the bees in the neighborhood worried themselves to death flying from blossom to blossom in search of nectar. Well, honey is scarce, and so are bees.

H. T. SEWELL.

Pleasanton, O., Nov. 19, 1889.

THE FIRE AT THE ST. JOSEPH EXPOSITION.

In preparing exhibits for fairs or expositions, especially where property of great value is carried on to the grounds, it were well to consider the chances of fire. One of our bee-friends has had a sad loss in that direction. See what he says:

All the books and things I got of you went with the rest. It seems like hard luck, as this was all we had laid up to do business with; but we are trying to make the best of it, and hope to be able to resume business in the spring. We had no insurance, and so it was all a clear loss. We had set up a very fine display of comb and extracted honey, and one of implements and bees. EMERSON T. ABBOTT.

St. Joseph, Mo., Sept. 23, 1889.

As such things are not very common, most of us have perhaps overlooked the matter of getting insurance on such property. We deeply sympathize with friend Abbott; and if any of the brethren feel like doing a little more than extending sympathy they might do so by consulting his advertisement, which appears on page 766, Oct. 1.

THE ROCKY MOUNTAIN BEE-PLANT SEED.

I send by this mail 5 lbs. of cleome (Rocky Mountain bee-plant). I sold the seed to Mr. Samuel Wilson, that he made the extravagant puff about. The party that speaks of sowing the cleomes in a box with damp earth in it, and letting it freeze till spring, then putting it where you want it to grow, has the proper idea, as it will not germinate without freezing, according to my experience. I have on hand about 100 lbs. of Rocky Mountain bee-plant seed, which I will sell in bulk, for \$1.00 per lb., or 10 cts. per oz., postage paid.

Jewett, N. M., Oct. 25, 1889.

W. S. MITCHELL.

A VISIT TO FATHER LANGSTROTH AND OTHER BEE-KEEPERS.

Friend Root:—As I have just returned from Dayton, after a visit to father Langstroth, I feel sure that our brothers of the hive will be glad to get reports from headquarters. I came hither from Cincinnati, O., where I left my esteemed friend, Chas. Muth, hale and interesting as usual. I am glad to say that I found the veteran bee-keeper had been enjoying better health of late, and we had quite a pleasant talk about bee-keeping and bee-men, past and present. Among those of whom we compared mutual reminiscences we spoke of the late lamented Joseph Woodbury, of Mount Stafford, Exeter, England, whose name will ever be remembered among British apiarists as the inventor of the improved box-frame hive. This hive, which was rather smaller than the standard Langstroth, was practically a square box about 10 inches deep, consisting of two wood frames connected by corner posts, the sides being filled out with lengths of straw tightly compressed between tin uprights attached to each corner post. The top was a wooden frame, similarly fitted, and the whole was protected from weather by an outer wooden case. The whole hive, though more expensive than wood, was found to be exceedingly durable; and from the non-conducting properties of straw, it combined all the advantages of the present chaff hive with the minimum of weight. Mr. Woodbury was the first to export the Italian and Egyptian bees into England; and at the time of his death he was making arrangements for

the introduction of *Apis dorsata*, the giant bee of India; and had it not been for his untimely decease the domestication of that bee in Great Britain would probably have been an accomplished fact. Mr. Langstroth's book, as revised by the Dadants, will be read with interest all over the world. There are, I understand, also to be German and French editions.

This has been only a fair honey season in Virginia, owing to excessive rains; but there has been quite a quantity of good fall honey made from the white aster, which yields a honey, the scent of which, when first gathered, can be noticed even when at a distance from the apiary.

H. STILLINGTON STEPHENSON.

Medina, Nov. 8.

CARP AND BEES.

Some of my bees nearly starved until some time in June. The honey-flow started, and kept up a gradual flow until frost. The flow was not as rapid as I have seen from white clover, but it lasted longer than I ever saw before, and the bees worked on red clover all the fall, so the bees had plenty to do from the time white clover started until frost stopped them. The quality is extra good, but the price is low and the demand light, on account of too big a crop. This has been a No. 1 honey year in this section of the country.

How are your carp doing? I placed 28 $\frac{1}{2}$ -lb. spawners in my pond last spring. This fall they weighed 2 $\frac{1}{2}$ lbs. We got about 2000 young ones, from 3 to 6 inches long, besides what a big turtle killed that was in the pond. The water got very low, so the fish were crowded, which gave the turtle a good chance to get fat on the young carp. We caught him when we drained the pond. We are wintering our carp, some in a large supply-tank 10 feet high, 10 in diameter, and some in a milk-tank supplied by a drilled well, 95 ft., and a windmill to do the pumping.

G. J. KLEIN.

Conrad Grove, Ia., Nov. 2, 1889.

Friend K., our pond is pretty well stocked; but we have not used very much of them for food as yet. Turtles and muskrats are much more troublesome when the pond gets low. Better turn the supply from your windmill into the pond so as to keep it always full. That is the way we do now, and our pond has never been low since the windmill was put up.

DOORSTEPS FOR BEE-HIVES; FLAGGING AND BRICKS.

I am to-night in receipt of the Nov. 1st issue of GLEANINGS, and I have just been reading friend Boardman's "Dooryards for the Bees." About 20 years since, I wanted to put my bees in a new yard, and have it look in decent order; so I procured flagstones larger than the bottom of the hives. At each corner, under the hive, I put half of a brick to keep the hive off the stones; and on the center of the flagging, in front of the hive, I put a whole brick for an alighting-place, so that, if a bee should fall on the ground short of the entrance to the hive, it could at once walk directly to the hive without having to rise on the wing. The stones should extend some inches beyond the bricks all around, and be raised slightly above the level of the yard; then it is an easy matter to trim off any grass or weeds that may grow up in the way of their homeward flight. I prefer stones of a light color, instead of

slates or dark-colored ones. I suppose they would not be so hot under the hives. The arrangement has given me entire satisfaction as a bee-stand, with no trouble from warping or rotting to be looked after. Care should be taken in placing the stones to have them level on top. C. RISLER.

Locktown, N. J., Nov. 4, 1889.

Very good, friend R. I suppose your hives have a permanent bottom, and, if set over the stones, water would collect and stand between the bottom-board and the stones. I think I should prefer to have the hives raised up from the stones a little, by a cleat clear around; then mice, spiders, etc., could not crawl between the hives and the stone.

GETTING RID OF SKUNKS BY MEANS OF POISON.

I just happened to be looking over a back number of GLEANINGS, and noticed two articles telling how to get rid of skunks. Now, I should like to add my mite. I was very much bothered with them, as they are very numerous here. I get a can of salmon, and treat it to a little good strychnine, and spread it around near the bee-yard. Fish of any kind is a choice morsel for them. I do not know how many I have killed; but I know I thinned them out in my vicinity. I once found one lying right where he found his supper. I am indebted to an old miner for this recipe. H. P. LUTHER.

Redlands, Cal., Oct. 31, 1889.

We are much obliged, friend L., for the fact you give us in regard to poisoning the "varmints."

NOTES AND QUERIES.

We solicit for this department short items and questions of a practical nature; but all QUESTIONS, if accompanied by other matter, must be put upon a SEPARATE slip of paper with name and address.

SMOKING TO MAKE THE BEES FILL THEIR HONEY-SACS.

When bees are disturbed by smoking them, and they fill themselves with honey, is the honey entirely lost, or do they return it to the combs?

Pipestem, W. Va., Nov. 3, 1889. G. C. HUGHES.

[Friend H., the honey is not exactly lost, of course, for the greater part of it will be put back in the combs, after the bees quiet down. But I feel quite certain that a great part of the honey is very often about as good as lost, where bees are made to fill themselves by smoke. This is especially the case with hybrids, or bees having enough black blood to tear open the cappings, and gorge themselves with honey every time the hive is opened or disturbed.]

FLAGGING FOR ENTRANCES.

You ask in GLEANINGS for the price of stone to use in front of hives. I have thin flagstone for that purpose, which cost me six cents a foot, superficial measure. A cheaper material, and one I think you will find as good, is slack coal.

Belle Vernon, Pa., Nov. 8, 1888.

A. B. BURD.

THE BLACK GRAMPUS; THE FLUID FROM ITS TAIL.

Friend Root:—The black grampus sent to Prof. Cook did discharge a greenish fluid from its whip, or tail. See page 843, Nov. 1. I placed it on a white cloth, and poked it with a stick, when it at once clinched the cloth with its claws and discharged from its whip this fluid, which was very offensive.

I had a moccasin snake this week for Prof. Cook, but it bit itself and died.
S. C. CORWIN.
Sarasota, Fla., Nov. 7, 1889.

JAPANESE - BUCKWHEAT FLOUR SELLING AT \$3.00 PER 100.

We have had a good honey crop here this season. I rented ten acres of land and sowed six acres to buckwheat. I received 120 bushels of seed. The flour will bring \$3.00 per hundred. I think it has paid me well for my trouble. Honey will average 12 cts. per lb.
J. W. MORRISON.

Oswego, Ill., Nov. 1, 1889.

[Friend M., I should say that you were getting very good prices for your buckwheat flour. It is selling here at from \$2.25 to \$2.50 per 100 lbs. The Japanese buckwheat will, without question, break down both the price of the grain and flour.]

OVER 1100 BUSHELS OF JAPANESE BUCKWHEAT FROM 40 ACRES.

I have raised this year 1170 bushels of Japanese buckwheat from about 40 acres, the best of it averaging 40 bushels per acre. This crop is from seed I bought of you in 1888; \$3.00 per bushel is the price I paid. As there is no market here for buckwheat will some one advise me how I can dispose of it to the best advantage?
MILTON PARKER.

Quick, Ia., Nov. 9, 1889.

KNOCKING PRICES DOWN WITH HONEY-DEW.

Bees here have been a complete failure this year. One man sold a lot of honey-dew at one of the stores. He sold it, I suppose, for good honey. That is what smashes the home market. People eat such stuff as that, and they are sick of honey, when perhaps they do not know how good honey tastes.

FRED C. FULLER.

Montague, Mass., Oct. 22, 1889.

PREVENTING INCREASE.

I am interested in methods of preventing increase when working for comb honey. Have we had all the available information about methods of proceeding, and of the success of the plan of removing the queen to prevent swarming? Can we not try Mr. Doolittle's new plan of preventing increase without transferring the bees to half-depth hives?
J. S. HUNT.

Charlestown, N. H., Oct. 29, 1889.

RHEUMATISM, ETC.

I used to have it a good deal, but have been pricked a good many times by the little "varmints." I don't have it now; and whether it is the stings or honey that I eat, I can not say.

The Ignatum tomato seeds were received late, and the ground was rather wet from so much rain; but they did quite well. I think, all things considered, they are the best tomatoes I ever raised—nearly solid, no rot, and fine flavor.
C. S. WALKER.

Grafton, Vt., Nov. 1, 1889.

I send the latest quotations on honey and wax, from the San Francisco Bulletin.

Honey—We quote: White comb, 10@12c; amber, 7@9c; white liquid, extracted, 5½@6c; amber, colored and candied, 4½@5c per lb. Beeswax—Quotable at 19@21c per lb.

St. Helena, Cal., Nov. 2, 1889.

W. C. AIKEN.

[Thanks, friend A. By the way, will not some of our California readers send us the names of one or more reliable honey commission men in their state? No one quotes the California market in GLEANINGS. We should like the names of one or two in New Orleans also.]

OUR QUESTION-BOX.

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 149.—a. How much per pound can we afford to pay for retailing-packages (of a capacity of, say, from one to five pounds) for extracted honey? b. Which do you prefer—glass or tin for the purpose? c. What sort of a label do you prefer for each; that is, large or small?

Where I have retailed extracted honey, the parties buying furnish their own packages.

New York. C.

G. M. DOOLITTLE.

a. A cent a pound in our town; a 5 and 3 lb. package sells the best. b. We use tin pails without labels.

Wisconsin. S. W.

E. FRANCE.

a. That depends entirely upon the advantage the package is in securing a price for the honey. b. Glass is the most attractive, or may be so. c. Medium size, and plain.

Ohio. N. W.

H. R. BOARDMAN.

a. I never sold my honey in a market that required such small packages, so I can not answer from experience. b. I prefer tin for larger packages. c. I never used large labels.

Cuba.

O. O. POPPLETON.

a. I allow one cent per pound. I deliver the goods at the store. b. Tin pails, holding 3, 5, and 10 pounds. c. A large label, well printed, with directions how to bring the honey back to a liquid state when granulated, etc.

Vermont. N. W.

A. E. MANUM.

a. My experience is limited. The whole affair depends much upon how your customers have been educated. b. At the same price, I should prefer glass. c. On glass, a small label; on tin, the larger the better.

Illinois. N.

C. C. MILLER.

a. I never have honey retailed in less than 10-lb. packages, on which I feel free to pay 10% for the selling. b. I use tin only. c. A large label, giving a number of brief points of information in reference to our occupation.

California. S. W.

R. WILKIN.

I can not answer. It depends on the market. I prefer useful glass cans like fruit-jars, or else jelly-cups, or else cheap tin pails. That is, I can market such most readily here. The Muth jars do not sell well. People say they don't wish to pay so much for a "bottle."

Michigan. C.

A. J. COOK.

a. We must buy vessels as cheap as we can get them, consistent with the style we want. b. We prefer glass jars for small packages up to 2 pounds; tin, for packages from 3 to 50 pounds. c. The label should always be in proportion to the package. Our tin cans cost from 1 to 2 cents per pound for honey.

Ohio. S. W.

C. F. MUTH.

I always sell extracted honey in the 25 to 50 gallon barrels, therefore I can't say; but as you have quoted prices of all kinds of receptacles for honey,

and no doubt know your market prices of honey, you certainly can estimate better than one who sells in another market. A neat and attractive label, and one that suits the package.

Louisiana. E. C.

P. L. VIALON.

a. I have never handled packages of less than 10 pounds for extracted honey. Dealers have generally handled honey for me for one cent per pound. b. Tin. c. One having good plain type, so they can be read easily—not too coarse and gaudy, like the cheap-soap advertisements.

Wisconsin. S. W.

S. I. FREEBORN.

a. We should pay more for a pound package, per pound, than for a 5-pound package. We pay about 3 cents per pound of honey for the small ones, and 1½ to 2 cents per pound of honey for the larger sizes. b. We prefer tin. c. Large labels, explaining that granulation is the best proof of its purity, and how to liquefy granulated honey.

Illinois. N. W.

DADANT & SON.

a. I don't know. I haven't retailed any for several years in anything else than yellow pails. I should prefer tin; and for the pound, a can without bail. Two to three cents a pound, I judge, would buy them. A neat and fair-sized label, in proportion to size of package, would be better than too much display. Its purity would be less questioned if without any label.

New York. C.

P. H. ELWOOD.

a. I don't know. I have had but little experience, my honey being mostly sold by the gallon, to consumers. b. I saw some very neat paper packages at the Detroit exposition, that I should think would be nice for the purpose. The cost would be less than one cent per pound. c. If the package is large, use a large label; if small, use a small one. If tin is used, cover with a neat label; if glass is used, use such a label as will allow the honey to be seen.

Ohio. N. W.

A. B. MASON.

The less we have to pay for a package, the more honey we can sell put up in that package. For any thing over a quart, I prefer tin to glass, especially for liquid honey. The package should be useful after the honey is taken from it, and we have no tin receptacle of less than that capacity that is of any use. Liquid honey sells best in glass, but candied honey better in tin. Glass jelly-tumblers do well for a small package, but are too expensive to sell a great quantity of honey in. Until the house-keeper gets all the jelly-tumblers she wants, they are the best thing we can get for a small package. The label for a glass package should be small. For a tin package it should cover the entire surface as far as possible.

Illinois. N. C.

J. A. GREEN.

The subject of this question is one of great interest and importance to bee-keepers. We can stand it to pay a cent or half a cent per pound for the cost of packages—I mean per pound of honey they contain; but you see when we get down to half pounds and pounds they must necessarily cost very much more. There is where the trouble is. In my opinion, tin is not going into general use for honey. Honey is not a staple, and never will be at any price for which we can afford to produce it. It is a fancy luxury, first, last, and all the time, and glass is the thing to put it up in, in packages of less than half a gallon. Use a small label on glass, so the

contents will show off well. If I used tin I should prefer to label it all over.

Michigan. S. W.

JAMES HEDDON.

This would depend upon the style of package. If the package itself would enhance the price of the honey, we could perhaps pay 2 cents a pound; but for a 5-pound package, the price should not be much over one cent. Our 5-pound packages, with label, cost 1¼ cents. b. We prefer tin for 2½, 5, and 10 pound packages; glass for any thing smaller. The latter should come under the head of fancy packages. c. For a 5-pound pail, a plain label, to go about half way around—the same size label used on all of our tins. For glass, a small fancy lithograph label.

New York. E.

RAMBLER.

I think we should keep the cost of package below 2 cents a pound, although for one-pound packages it may be necessary to go higher. I prefer tin. As to label, I am just heathen enough to think it is a good plan to sell honey without any label at all. The general public know more than you give them credit for, brethren. They actually know that it takes time and expense to make honey-packages look like Solomon in all his glory, and that they have to pay for it all. With all the wealth of ornamentation that we have now almost everywhere, they don't care to have their honey-cans decorated by Raphael and Rubens. One of the best strikes a body can make is to induce his customers to think he is trying to furnish them with good honey as cheaply as practicable. People like to believe this—and if it is true, it is not so very hard to induce the belief. To avoid all needless clap-trap that makes expense, is one good way to convince people that you are thinking of their interests as well as your own.

Ohio. N. W.

E. E. HASTY.

There seems to be a pretty fair agreement all through the above answers. Two of the friends, however, Elwood and Hasty, suggest that, under some circumstances, honey will sell better without a label than with. After people get acquainted, and know you, they do not care any thing about a label. In fact, I have noticed the disposition that friend Hasty speaks of. It is something like this: "Give me some honey as cheap as you can, and in the cheapest possible package. I do not want any show or display. I just want some genuine honey." When we first began selling horseradish on our wagon I thought it was very important to have a label on it, telling that the horseradish was put up with the very best quality of white-wine vinegar, and that the entire work was in the hands of careful women in our establishment, so it was pure, clean, and wholesome. The boys, however, very soon began to report that people preferred it without any label. The label made it look as if it came from a city manufactory, and they preferred home-made horseradish in plain clean bottles. White flint-glass bottles, instead of green window-glass, was a decided improvement. When, however, some careless packer let a fly or two get into the bottle in such a way that customers could see it, it was an advertisement in the wrong direction, *you may be sure*.

HUMBUGS AND SWINDLES

PERTAINING TO BEE CULTURE.

THE GOLDEN BEE HIVE, AGAIN.

Dear friend Root (for I have learned to love you as one through GLEANINGS):—Inclosed please find a circular containing something about the Golden hive. I saw in GLEANINGS, Sept. 15, 1889, page 693, that the circular is a fraud. Mr. J. B. Pickler is now in Concord, Cabarrus Co., N. C., selling farm-rights for \$8.00, and giving a hive. Please publish the same in GLEANINGS, and send a copy to our local paper, *The Times*, Concord. He promised me to-day that he would publish what you had in GLEANINGS. Concord, N. C., Nov. 14, 1889. S. L. KLUTTS.

The day after, friend K. writes again as follows:

Mr. A. I. Root:—On my way home yesterday evening, J. W. Carriker showed me a circular that J. B. Pickler had given him on you, which you will find inclosed. We do not like to see such reports circulated on you, for we have come to love you as a true Christian gentleman. Of course, we know nothing of GLEANINGS ten years ago, but we do not believe one word of it. I am trying to get all the evidence that can be had concerning the Golden bee-hive man. I wrote to A. J. Cook, asking him if it was true that he ever used the Golden hive. Please send a copy of GLEANINGS to *The Times*, Concord, with the article marked. He promised to publish it. Also send a copy to J. C. Klutts, who bought a farm-right of the Golden bee-hive. His postoffice is Clear Creek, N. C. Send one to J. W. Carriker, Pioneer Mills, N. C. S. L. KLUTTS.

Clear Creek, N. C., Nov. 15, 1889.

Here is another letter from another friend in the same vicinity:

Mr. A. I. Root:—I have been a subscriber to GLEANINGS for some time, and have become somewhat attached to you in that way. But there is a gentleman in our county (if I can call him such) who is selling the Golden hive, and circulating scandalous circulars concerning you. In looking over GLEANINGS I find him advertised in the September number, 1888, as a humbug. I tell you, I just felt like saying Sunday-school words to him when he tried to injure a man whom I have every reason to believe is honest, and a Christian, and is trying to better his fellow-man. Please to give the gentleman a hearing in the *Concord Times*, a weekly paper published in our county.

R. J. CALDWELL, M. D.

Clear Creek, N. C., Nov. 15, 1889.

We do not need to occupy very much space in noticing these circulars. A single sentence from the large circular will be sufficient:

Prof. A. J. Cook, of the Michigan Agricultural College at Lansing, reports over \$80.00 from each swarm of bees kept in the Golden hive last year.

Our friends will notice that this is the same thing we gave in the September issue. Now, a man who will, year after year, print such a statement, when Prof. Cook never made any such report, and never had the Golden bee-hive in his apiary at all, would probably do any thing to get money. In regard to the small circular alluded to, slandering your humble servant, I will only say that it is on a little sheet *without a date*, put

out by N. C. Mitchell about *ten years ago*. A sentence, or even a part of one from this circular, will explain why Mitchell got it out.

"No doubt many of you, and especially those who read GLEANINGS, know that A. I. Root has kept our name at the top of his Humbug column"

This is true. N. C. Mitchell has been advertised as a humbug and swindler, off and on, for toward fifteen years. Good father Langstroth, in commenting on the matter, once said, "If Mitchell had employed the same talents, skill, and education, in honest work, that he has in trying to defraud, he might have been well off." This is no doubt true. Well, he who exposes humbugs must expect slander and abuse. Many of the present readers of GLEANINGS may perhaps not be aware that your humble servant has not been preaching Jesus Christ all of his life. When there came a change it was a great change. "To be carnally minded is death; but to be spiritually minded is life and peace." Mitchell, of course, picked up fragments of the old A. I. Root, and thought with these to frighten me from my purpose of exposing him. Of course, I did not frighten worth a cent; for he who is serving the Master has nothing to fear, even from his enemies. Do not be troubled, dear friends. Let the enemies of truth and honesty scatter as many circulars as they please; they will not harm your old friend. His trust and refuge is with Him who said, "Blessed are ye when men shall revile you, and persecute you, and say all manner of evil against you falsely, for *my sake*." Something comes in here, however, which I do not understand. What has Pickler or the *Golden bee-hive* to do with Mitchell, with his old adjustable hive? It seems to me that we are unearthing and bringing to light an old humbug under a new guise. We are very much obliged to the friends for giving us prompt notice of the patent-hive frauds. When Mitchell was exposed in one locality he moved to another. In fact, he started out in different localities, north, south, east, and west; but when he found that a subscriber of GLEANINGS popped up in almost every neighborhood, he seemed to lose heart, and, we hoped, had concluded, as good father Langstroth had said, that more money was to be made in honest, legitimate business, than by trying to get it by falsehood and fraud. We have heard of nothing in regard to Mitchell now for some years. When friend K. gets his answer from Prof. Cook, we hope he will place the matter in the hands of the proper authorities, and have Pickler arrested. If money is wanted to bring him to justice, we shall be glad to help furnish it.

Since the above was written we have been printing a lot of order-sheets for friend Jenkins. On the back of these he has the following:

A WARNING!

Stop thief! I hail the vender of "Rights" to use the "Golden," the "Bernheim," and other so-called patent (?) bee-hives. *Quit your meanness*, and make an honest living by doing something else than going about the country, taking people's money for nothing.

Let us review the matter of patented hives a little. In 1851 the Rev. L. L. Langstroth invented and

patented the first practical bee-hive the world ever knew. Its principal features were the movable frame and bee-space. As Mr. Langstroth's patent expired more than twenty years ago, his hive, and all its valuable features, are public property. Since that time hundreds of patents have been issued on bee-hives, and the great majority of them have been on claims or principles worse than worthless. It is an easy matter to get a patent on any novelty or new design, even if it is practically useless. Thus it is easy to attach some clasp, feeder, fixture, or something patented, to an otherwise unpatented hive, and the combination proclaimed, with a slight degree of truth, a *patented hive*! Some so-called patented hives have been industriously shoved in communities; and the people would afterward discover that there was no patent on the hive at all, may be on no part of it, and that they had been duped by swindlers who had sought fresh pastures elsewhere. In either case the usual result is, the purchaser of the "Right" finds himself in possession of the plans for a hive that no one but a first-class mechanic can construct properly (as the majority of them are very complicated). Such labor costs more than he can afford to pay, and he does not use his "Right" after buying it!

This is a significant fact; think of it: The largest and most successful bee-keepers in the world—men who produce TONS of honey, and who make bee-keeping a life study, do not use patented hives! They are posted, and would not hesitate to pay \$100 for the right to a hive that would give them any advantage over the unpatented hives they use.

Bee-keepers and farmers, put your bees into good unpatented frame hives, and keep them as they deserve; and if you want to make your own hives, do so; but don't pay any man a cent for the right to make them. If the patent-hive agent calls on you or gets into your neighborhood, set the dog on him; show him up; warn your neighbors of him; make it unpleasant and unprofitable for him, and he won't abide with you long.

My friends, these are hard things to say; but the Southern people have been and are being so imposed upon that I feel justified in thus warning them. If you don't believe what I say, write to the editor of any bee-paper in America, and ask him if I am not right.

MYSELF AND MY NEIGHBORS.

There shall arise false Christs and false prophets, and shall show great signs and wonders; inasmuch that, if it were possible, they shall deceive the very elect.—MATT. 24 : 24.

AS a rule, those who follow Christ Jesus are expected to show, in their daily conduct, love and kindness; and perhaps I should say, *only* love and kindness under *all* circumstances and on all occasions. Jesus conquered by love. It is true, that on one or two occasions he had to drive certain people from the temple. He even used a whip of knotted cords, and turned their money-tables over. But these few occasions are isolated, and stand almost alone. His mission in this world seems to have been mainly to *persuade* people toward better ways. If they would not be persuaded, they were allowed to go on in their own evil ways. We therefore, then, who are *followers* of Christ, should do our work in the spirit of love and kindness. This the world has learned to recognize and expect. When we attempt to enforce law and order in any other way, very likely we shall hear, "A pretty specimen of a Christian you are!" or, "Do you call that Christianity?" Well, even if we do meet such words and opposition, I believe that every true Christian is called upon, sooner or later, to meet Satan in a regular pitched battle. I would not *court* controversy nor quarrel nor conflict;

but I think there is a time when forbearance ceases to be a virtue. A very simple incident will perhaps illustrate my meaning. A good deal is said about ruling dumb brutes by love and kindness. In fact, I am a strong believer in the doctrine myself. I would not pound a balky horse, neither would I allow it to be done in my presence. I would strive, however, to accomplish what I wish, by mild words. We *may be* mild, and yet firm at the same time; but with me it is one of the most difficult matters that I have ever had to meet. Our old Charlie, that draws the market-wagon, is an excellent horse for business. He is large and strong, and ambitious; yes, he will work until he falls down, if you let him. He will also stand hour after hour, all over town, and we never think of such a thing as hitching him. At the same time, he has some little notions that are not pleasant, and, like one of the human family, he very soon discovers whether he can make his driver respect his notions or not. If his driver is a man who knows what a horse *ought* to do, and is determined to make him do it, he submits readily enough. When we back the market-wagon out of the house built expressly for it, sometimes when the roads are heavy the thills are dropped partly on the plank sidewalk. Old Charlie has a kind of theory of his own, that sidewalks are made for *men* and *women* to walk on, but not for *horses*. He will not step on the walk if he can help it; and if he is obliged to stand there, he backs and stamps and twists. I have often remonstrated with the boys for allowing him to have his own way; but rather than have a tussle with him they push and tire themselves out in backing the wagon off through the mud. When I remonstrated, one of them asked *me* to make him step into the thills while they were across the sidewalk, if I thought I could do it. He backed so stubbornly that I had much difficulty in getting the thills through the straps, and then he came very near breaking them by trying to get off from the planks, cramping them sidewise. We were late that morning, and so I let him go. Another morning, when we had more time, I told the boys to wait until I had taught the horse a lesson in obedience. I had had a like experience with him before in other things, and I knew what was needed. I did not want a whip. I simply wanted a little stick—a short piece of lath suits me best for such a purpose. I waited until I found it, and then I took him by the bits, and said, decidedly, "Now, Charlie, behave yourself, or there will be trouble." He saw the stick in my hand, and knew by my tones, doubtless, that there was not going to be any fooling, nor time wasted. I took pains to hold the stick where he could see it clearly. He stepped into the thills, without any trouble whatever. When we began to raise them he commenced back, as on former occasions. I simply raised the stick, and said, firmly, "Look here, sir! you behave!" That was all. He did exactly as I wanted to have him, without any fooling, and without wasting perhaps five or ten minutes. The next time, he behaved well without

any stick; but when the boys tried to handle him he behaved just as he had on former occasions. I presume he rather enjoys having a tussle. Very likely it varies the monotony of going around from house to house, and standing still, doing nothing a great part of the time.

Now, my friends, please do not get an idea that I think we ought to make everybody toe the mark according to *our own peculiar notions*. God forbid. Most of us are, however, called upon, sooner or later, to be responsible for the conduct of others, to a greater or lesser extent. When God spoke to Samuel, pronouncing judgment on Eli, the accusation was, "His sons made themselves vile, and he restrained them not." The three little words tell the story—"restrained them not." The Scriptures tell us that he remonstrated, and doubtless protested. He told them they *ought* not to do so, but omitted to say any thing about *must*. But they did so, notwithstanding. "What is to be done?" do you ask? Well, I should say take a lath, as I did to old Charlie. Very likely you may not need to use the lath any more than I did; but if you can not give the boys to understand in any other way than that, that you *mean* what you say, by all means take a lath. I think, however, the parent who is in real earnest can get along without any lath or rod either. He must be prepared, however, to enforce obedience, even though it cost a conflict. One who teaches school is in the same position, only his field is a wider one. One who is employed by the government to look after government property has a still wider field. One who is employed by a great institution to look after the men and women who do the work, in the same line has responsibilities that he can not safely evade. I know the workmen are sometimes inclined to feel ill will toward the foreman who "squeals." Now, it is bad to lose the good will and hearty co-operation of those over whom we have charge; but it is a worse thing to let them have their own way, and destroy or pilfer the property of the employer.

Shall I tell you, dear friends, what has led to this long preface? Well, it is because I have been feeling for some time that there were some few things that I ought to touch upon, even through these Home Papers. I have hesitated, and have forbore to do so because I might hurt the feelings of a good many—perhaps some near and dear friends. Even though this be true, however, I ought not to hesitate to say things when I see others suffering and being led into error while I say nothing. Of course, I ought to be *very sure* that I am not in error myself; and in matters where there are differences of opinion, perhaps it is often as well to let them alone. GLEANINGS has for years kept up what we call a Humbug and Swindle department. A good many times, however, this department has been out of sight because it is so extremely necessary that I make no *mistake* in the matter; that is, that the thing pronounced to be a humbug and swindle be most unmistakably and clearly so. And even when it seems there can be no question or doubt in the mind of any sane individual,

there will still be a few who insist that the thing is honest and legitimate. A great trade is now being carried on in our country in what are called electrical appliances for the cure of disease. I am firmly satisfied that these are, without question, *humbugs and swindles*. The fact that many have tried them and have been helped (in their opinion) does not change my convictions a particle; neither does the fact that there are large manufacturing engaged in making electric medals, belts, bracelets, braces, jackets, hair-brushes, etc. My friend, if you have any confidence at all in A. I. Root, please believe that he knows when he tells you that these things by themselves have no effect whatever in the cure of disease. Electricity has been my study a great part of my life, and almost a passion from childhood.

I know, while I speak, that many of you will not believe me. Even in our own establishment, electrical belts have been purchased by women who are comparatively poor; yes, and they have paid as high as ten or fifteen dollars for them to smooth-tongued agents. Worse still, the agent was a woman; and it is not a very pleasant task to tell a woman that she is a humbug and a swindler. This woman carried a magnetic needle which she placed on the table; then because it flew around when she moved the belt under the table, with the statement that the belt exerted a powerful influence for the cure of disease, it carried conviction. The belt was made of a string of magnets. I know that many of you insist that magnetism has power over disease. Let me quote from *Scribner's Magazine*, for November, page 598. The article was written by M. Allen Starr, M. D.:

The most careful experiments have shown that the human body is as completely insensitive to magnetism, and as wholly unaffected by it, as a piece of rubber or of wood. A person may stand between the poles of the strongest magnet, one which might hold up a ton of iron, without the slightest perceptible effect upon any of the bodily functions being produced. Hence all so called magnetic appliances, brushes or combs, disks, belts, and magnets, have absolutely no curative power whatever.

Magnetism is not electricity; but even if it were, it would do you no good. Later on, a gentleman came into our office and wished to show me a belt that *really* gave forth a current of electricity. When I took the ends in my fingers there was, unmistakably, a feeble electric current. The belt was made of zinc and copper. It was wrapped in a cloth moistened with some acid. He said it was dipped in a solution of weak vinegar every morning to start the current.

"Very good," said I. "You have an electric current here; and I may say this is the first time that I have ever seen a trace of electricity from these so called belts, medals, etc. But, my friend, do you know that even this current of electricity has little if any power at all in curing any sort of disease?"

He owned up that I was right. "But," said he, "Mr. Root, the world is so crazy for something in the way of electricity, that the fact that they can feel the current does

a wonderful sight toward making them feel better."

This agent was honest enough to admit what I knew to be true. He had once been a bee-keeper, and had read GLEANINGS. He had quite a talk with me on the matter, and I am pretty sure he has never sold any more electrical belts. Perhaps it is true, that electrical instruments in the hands of your family physician may at times prove beneficial; but your family physician, if he is well informed and honest, will tell you that the effect is more upon the imagination than upon the body. Mrs. Root had one of the latest and most improved machines in the house for several weeks. Our family physician advised her to try it for neuralgia. She and I were anxious to succeed just a little with it, and for a double reason. We were both compelled, however, to decide that it had no effect, after giving it an extended trial. The same article I have quoted from in *Scribner's Magazine*, "Electricity in Relation to the Human Body," gives the following on page 599:

The curative powers of electricity are really very limited, and have often been exaggerated by those to whose interest it is to urge them.

Now, then, friends, if it is a fearful thing to take the money of poor, hard-working women, and give them something under the pretense of science which really is as ineffective as a horseshoe nailed over a door, there is a kind of humbugging and swindling growing rapidly among us, that is, in my mind, a *hundred times worse*. It comes under different guises and under different names. It is this matter of curing disease by what the advocates term the prayer or faith cure. The manufacturers of electrical appliances, although they are swindling the masses, do not call upon the Almighty to witness that they are honest. Nor do they pretend that they have a special power from on high to heal by touch, as did our Savior, or to heal by simply praying when miles distant. I know there are many among our readers who will, perhaps, be greatly offended because of the above; and many, no doubt, will refuse to have our journal any longer in their homes. You will say that I am wrong. You will say that I have not seen the *right kind* of faith cure. Some of you will say, that I am entirely unacquainted with Christian science. I assure you that I have taken pains to acquaint myself repeatedly, only to discover, after sufficient investigation, unmistakable signs of the cloven hoof. I heard of it in different places in California, and I met it in Wisconsin. It is round about my own home. In fact, near relations have sent money to pretenders in cities far away to have them pray for them. Men who have never prayed for themselves are praying for others, for a fee of \$5.00 per hour. You must pay \$5.00 before any praying is done. It reminds me of the reply of Peter, as we read in the eighth chapter of Acts: "But Peter said unto him, Thy money perish with thee, because thou hast thought that the gift of God may be purchased with money. Thou has neither part nor lot in this matter, for thy heart is not right in the sight of God." When-

ever I hear of these things I at once make inquiries in regard to the character and reputation of the one who pretends or professes to effect the cures; and every time it seems to me that Peter's answer fills the bill exactly.

Many of them profess to love the Bible and the Christian religion. They want to walk hand in hand with Christian people. For a time I have been deceived myself. Sooner or later, however, it comes out like the little story in the 16th chapter of Acts, as follows:

And it came to pass, as we went to prayer, a certain damsel possessed with a spirit of divination met us, which brought her masters much gain by soothsaying. The same followed Paul and us, and cried, saying, These men are the servants of the most high God, which shew unto us the way of salvation. And this did she many days. But Paul, being grieved, turned and said to the spirit, I command thee in the name of Jesus Christ to come out of her. And he came out the same hour.

You will no doubt tell me that the followers of Christian science in your neighborhood do not receive money; that they do their work as Christ did his, without fee or recompense. I have heard this repeatedly; but in every case where I have followed it out I found that it was not true. The five or ten dollars came in somewhere. Of course, they explained it by saying that the money was a free gift from some person or means who felt grateful. Very well. Ask these persons who have been healed, after a few months have passed, how it turned out. It is like the poor girls in our factory, who would not listen to me. Sadly and sorrowfully I was obliged to give up arguing, and to wait a few weeks or a few months, until the things were thrown aside, and remembered only as mistaken notions that did not stand the wear and tear of every-day life and of every-day experience. Your family physician, through his medical journals, is promptly informed of every inch of progress made in the way of new remedies and new methods of curing disease. He knew all about electricity and its applications in this line years ago. New discoveries, of value, do not come through traveling agents without name and without reputation. In the same way our established ministers of the gospel are perfectly competent to advise in regard to the cure of disease by prayer. Do not let anybody persuade you that God is more ready to hear *somebody else* pray for your afflictions than he is to hear such a prayer as you can make your own self. I have, through all my Christian life, been in the habit of asking God to help me and give me light in regard to this matter of sickness and pain. After such prayer, I have many times been strongly impressed with the importance of *pure air, pure water, plenty of sunshine, plenty of sleep, etc.* Perhaps when I am suffering bodily pain I pray for myself with a little more earnestness than I do for others; but I hope I am not so selfish as to pray for myself only. Sometimes, it is true, I pray for those who *will not* pray for themselves; but I pave much more faith when I know the afflicted one is lifting up his heart also to the great Judge of all the earth. If you are under great affliction, by all means ask your pastor or your believing

friends to pray for you. But do not, I beg of you, think of *paying money* to somebody, for a little careful reading of your own Bibles will show you that such a course is almost exactly in a line with Simon the sorcerer, or the damsel that grieved the heart of poor Paul. Perhaps I should say a little more about those who declare that they have experienced this relief that is almost miraculous. The article I have copied from *Scribner's Magazine* touches a good deal upon this point. Let me give you an illustration from my own experience.

When Warner's Safe Cure first became advertised so extensively, I, like thousands of others, imagined that it was just what I needed. I purchased a bottle at our drug-store, and was so greatly benefited, that, had it not been for Mrs. Root, I *might* have come out in print and advised all the readers of GLEANINGS and all the friends of A. I. Root to buy Warner's Safe Cure. By her advice I waited awhile. I bought a dozen bottles. I took the medicine according to directions, for a month. Then I stopped for a month, and varied the test repeatedly until I became fully satisfied that it had no effect on me whatever. My explanation is something like this: There was a great excitement about the new medicine and its wonderful cures, made known by testimonials from great men. I was animated and enthusiastic over the idea of getting relief. I had *faith* enough to expect speedy results. The faith and the animation of testing *something new* seemed to bring what I hoped for. Perhaps the result was somewhat due to my specially hopeful organization. After I had finished eleven bottles my difficulty was a little worse than it had ever been before. I do not think, however, it did any harm at all *in my case*. (A teacupful of hot lemonade, just before going to bed, is the remedy I now feel like recommending.) I can tell you, however, of a case where the Safe cure *did* do harm. It resulted in the loss of the life of a most valuable man. He needed the advice of a competent physician. Dreading to consult one, however, he, like myself, was attracted by the wonderful promises of Warner's Safe Cure, so he depended upon that *instead* of upon the physician. When the doctor was *finally* summoned, it was too late. Had he first consulted even a member of his own family who was teaching physiology and anatomy, his life would, without question, have been saved. He, however, kept the matter to himself, and trusted in the patent medicine. My friends, these things can *never* take the place of the family physician and the pastor of your church.

Before I leave this matter of patent medicines I want to say that I do not believe it honest and upright to advertise by trickery. Any thing that can not be brought to the people boldly and squarely, I should be suspicious of. I also believe that the editor who humbugs his readers by giving them an advertisement in the reading-columns (couched in such terms as are generally used for reading-matter) will suffer for it sooner or later. Suppose, for instance, the druggist in your town should go to the doc-

tor, and say, "Look here, doctor, I have a great lot of old medicine on hand that is out of date. If you will recommend it to your patients I will give you half I get for it."

Now, suppose that the doctor should, in his smooth and natural way, tell his patients right and left that he had found something of great value at the drugstore, and that he could honestly recommend it for the very difficulty in question. No doubt both parties would get quite a lot of money. But, when you come to find out what had been done, how would you feel toward the doctor and toward the druggist? They would very soon be obliged to move out of town. It is the same with the editors of newspapers. They are expected to give advice as the family physician does; and if they abuse this trust, by recommending something they know nothing about, because they are *paid* for lending their name and influence, *we betide them*. It has been urged, that, when we employ our pastors to our separate churches, we hire them with money to pray for us. The statement is not true. The pastor of a church is employed, like the superintendent of a school or of a factory, to look after the *best interests* of all employed. Now, neither the pastor nor the school-teacher, nor the foreman of a factory, can do his work well, *in my opinion*, without being a praying man. But that does not mean that we pay him money to get him to pray.

A few days ago I found on my table a paper written by our stenographer, W. P. Root. It was in reply to a question from one of his fellow-workers as to what he thought of a certain journal devoted to Christian science. I think it will answer nicely to close our talk with to-day:

Friend L.—If you will but examine for a moment, what those Christian (?) scientists claim, you and I can have but one opinion of them. They claim, for instance, to cure disease by *thought*. They put Christ in the same kettle with a dozen imaginary characters in the poetical books of the Hindoos, coin a lot of big and unpronounceable words, boil the whole together, and call it Christian science. They ask us to throw aside all the conclusions of modern science in regard to medicine. I have no patience with a man who will put Jesus Christ's name down as a mere fetich, as of no more value than a horseshoe, to insure us against bad luck. Is it any wonder that such men should print large books, telling us what to do with children that are born when the planets are in a certain position in regard to each other? What sense is there in that, any more than in consulting the wagon-tracks in the road? The planets exercise no influence upon us, except to preserve the equilibrium of the solar system. If "fools rush in where angels fear to tread," this Christian science, or esoteric philosophy, is a splendid proof of it. Well did Christ say, that in the last days men should arise, deceiving, if possible, the very elect. But the greatest surprise is, that humanity at large can be so easily led astray by the talk of these men. They speak in a friendly manner of the Bible, of God, and of Christ; but Christianity has never had such terrible enemies as those that cast out devils in her name. We may be sure that God has given these men no particular measure of wisdom above

other people. Their pretensions are palpably absurd. Of course, some things they say are true; but these truths are mere spangles on a garment of falsehood. In its open attack on Christianity, infidelity has spent all its venom. Christianity has proved itself to be of divine origin by its fruits; and now Satan appears in another garb—that of a hand-maid—begging to walk along with Christianity. But of this be sure: At the last great day it will be said, "Depart, I never knew you." W. P.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

That art on which a thousand millions of men are dependent for their sustenance, and two hundred millions of men expend their daily toil, must be the most important of all—the parent and precursor of all other arts. In every country, then, and at every period, the investigation of the principles on which the rational practice of this art is founded ought to have commanded the principal attention of the greatest minds.

JAMES F. W. JOHNSTON.

TOMATOES AND TOMATO CULTURE.

Editor Gleanings:—

I am becoming enthusiastic over tomato culture in winter. We have only hard frosts here; no snow nor much ice; I want the kinds of tomatoes that bear the largest crop late. What kinds of tomatoes stand freezing best, have the largest crop of green tomatoes, late and strong grower, etc.? Nice tomatoes in winter bring a handsome price here as elsewhere, and no great protection is needed. Does the tomato stand heavy fertilizing, like strawberries and some kinds of vegetables?

Fresno, Cal., Nov. 12, 1889.

O. S. DAVIS.

Friend D., I should say that you have wonderful facilities for growing tomatoes in the winter time. As they are a tender tropical plant, however, you will need to protect them, not only from frost, but they seem to be a good deal injured when the thermometer gets down to about 40 degrees. Most plants, when the leaves are scorched by frost, will recover, and grow about as well as ever; but the tomato seems to be hurt clear down to its roots whenever even the tops of the foliage are frosted. I do not think there is very much difference in varieties, so far as standing cold is concerned. Perhaps in your locality a cold frame in a protected situation will be all that is needed. I am afraid, however, that you will need a little heat during severe spells. If the sash were so you could cover them with mats or shutters, you might be able to get along without any heat at all.—The Ignotum gives the largest crop of green tomatoes of anything we have ever had, and they are of a nice shape as a rule. We had wagon-loads on the ground, after frost this season. Some of them are fit to use after one or two or three pretty severe frosts. I believe, however, that the little pear or plum tomatoes will stand more freezing than any other variety. Only yesterday, Nov. 27, I took up some from the ground that looked to be sound and perfect, and they tasted almost as well as if they had not been frozen at all; yet I presume they have been frozen as hard as bullets more than a dozen times. In fact, we have had one freeze that would hold up a horse, and yet these toma-

atoes were scarcely harmed.—My experience is, that tomatoes will not bear fertilizing like strawberries. Of course, the manure gives large quantities of fruit; but they do not ripen with us before frost, near as well as when they are put on poor ground. To get the earliest of almost any thing, you need rather poor soil, on a hillside facing the south.

The October Bulletin of the Experiment Station of Cornell University, Ithaca, N. Y., is just at hand. This number is devoted entirely to tomatoes. Prof. Bailey says, in regard to the Ignotum:

This variety, which originated with the writer, is a sport from Eifforgie Dauer, a German variety. It appeared in a very large tomato test made in 1887. It was sent to several parties the following year, and a plantation of 500 plants was made by the writer. Last year it showed some tendency to revert, but careful selection has been practiced, and our plants this year, 422 in number, were all true to type, with the exception of the variation due to culture, as discussed on page 116 of this bulletin. The Ignotum is without question by far the finest market tomato which we have ever grown. Its particular points of superiority are large size, regularity of shape, solidity, productiveness, and uniformity throughout the season. It is the largest and heaviest of the perfectly regular tomatoes, and the most solid of any of the market sorts. The pickings from our patches this year were usually fit for market as they came from the vines; and the last picking, October 10th, after a long season, was scarcely inferior to the best picking of the season.

On the last page of their bulletin we find the following summary in regard to tomato culture:

1. Frequent transplanting of the young plant, and good tillage, are necessary to best results in tomato culture.

2. Plants started under glass about ten weeks before transplanting into field gave fruits from a week to ten days earlier than those started two or three weeks later, while there was a much greater difference when the plants were started six weeks later. Productiveness was greatly increased by the early planting.

3. Liberal and even heavy manuring, during the present season, gave great increase in yield over no fertilizing, although the common notion is quite to the contrary. Heavy manuring does not appear, therefore, to produce vine at the expense of fruit.

4. The tests indicate that poor soil may tend to render fruits more angular.

5. Varieties of tomatoes run out, and ten years may perhaps be considered the average life of a variety.

6. The particular points at present in demand in tomatoes are these: Regularity in shape, solidity, large size, productiveness of plant.

7. The ideal tomato would probably conform closely to the following scale of points: Vigor of plant, 5; earliness 10; color of fruit, 5; solidity of fruit, 20; shape of fruit, 20; size, 10; flavor, 5; cooking qualities, 5; productiveness, 20.

8. Solidity of fruit can not be accurately measured, either by weight or keeping qualities.

9. Cooking qualities appear to be largely individual rather than varietal characteristics.

10. The following varieties appear, from the season's work, to be among the best market tomatoes: Ignotum, Beauty, Mikado, Perfection, Favorite, Potato Leaf.

11. The following recent introductions appear to possess merits for market: Bay State, Atlantic, Brandywine, Jubilee, Matchless, and perhaps Lorillard, Prelude, and Salzer.

12. The following recent introductions are particularly valuable for amateur cultivation: Dwarf Champion, Lorillard, Peach, Prelude.

By the way, on the first page of the above bulletin I found a little paragraph from the pen of James F. W. Johnston, that pleased me so much I have given it a permanent place at the head of my talks on raising plants. See head of this department.

THE KUMERLE LIMA BEANS.

We have succeeded in saving a few seeds, but not many. The principal trouble with the bean seems to be the difficulty of getting the seeds to ripen up dry. They just stay fit to shell, for weeks and weeks. We covered them from frost quite a while, then pulled the stalks and put them in the greenhouse, but they kept green, even then. Finally we placed the pods on trays, and dried them by steam heat; but some of them molded, even then, before they had dried. Now, this is a splendid feature so far as having the beans to *cook* is concerned; but it is not very splendid where you want them for seed. In order to find out what they would be worth another season, I addressed a card to Thorburn, the introducer. Below is his reply:

Dear Sir:—We shall not have any of Kumerle's lima beans to offer this season. Yours truly,
New York, Nov. 14, 1889. JAS. M. THORBURN.

GLEANINGS IN BEE CULTURE.

Published Semi-Monthly.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, OHIO.

TERMS: \$1.00 PER YEAR, POSTPAID.

For Clubbing Rates, See First Page of Reading Matter.

MEDINA, DEC. 1, 1889.

Then Saul (who is also called Paul), filled with the Holy Ghost, set his eyes on him and said, O full of all subtlety and all mischief, thou child of the devil, thou enemy of all righteousness, wilt thou not cease to pervert the right ways of the Lord?—ACTS 13: 9, 10.

WE have at this date, 9161 subscribers.

EARLY CATALOGUES.

THE first catalogue for 1890 that comes to hand is from Jno. C. Swaner, Salt Lake City, Utah. He advertises nursery stock and bee-keepers' supplies. We have just printed catalogues of bees and supplies for John H. Kunderling, Kilmanagh, Mich., and for F. W. Lamm, Somerville, O. We have also just finished the annual catalogue of J. M. Jenkins, Wetumpka, Ala., which all our Southern friends will do well to send for.

GLEANINGS AND THE A B C BOOK FOR COUNTY INFIRMARIES.

MRS. CHADDCK mentioned, at the close of her article on page 951, the advisability of sending sample copies, etc. We will with great pleasure furnish a copy of the A B C book, and GLEANINGS regularly, without charge, to any infirmary or asylum for the insane, in Wisconsin, or any other State or place in the world, where there is anybody interested enough in bee-keeping to care for it.

LOOK OUT FOR HIM!

B. G. LUTTRELL, formerly postmaster of Luttrell, Dekalb Co., Ala., is complained of by several bee-keepers. He probably obtained credit by the fact of his being postmaster. As a rule, postmasters are supposed to be good straight square men; but we find now and then an exception. It seems to me, however, that there is a wrong somewhere, when a

man who is not responsible is given such an important position.

HORSE-RACING AND FAIRS.

TWO of the friends take me to task for recommending fairs while so many of them encourage horse-racing, gambling, lotteries, etc. I am well aware of this; but it is not true that *all* fairs encourage even horse racing. Intoxicating liquors are, I believe, ruled out from most of them. Games of chance are fast following in their wake, and quite a few counties are holding excellent fairs without any horse-racing. If it is thought best I can publish a list of these last. So long as fairs are mainly for the encouragement of agriculture, the arts, and industries, I am sure it is not best to turn our backs on them, even though most of them have these objectionable features. Let all the good people attend, be present at the annual meetings for discussing these matters, and let us work for these reforms that are still under way.

PRICE OF ALFALFA SEED.

ON page 954 we are told that alfalfa seed is worth \$3.00 per bushel in Kansas. In our catalogue the price is given as *ten dollars* per bushel; and, in fact, considerable quantities were sold a year ago at \$10.00 per bushel. This looks rather bad. Now, if any of the bee-friends have alfalfa seed for sale at any thing like \$3.00 per bushel, please let them speak out, and we will remodel our price list. By the way, I think it will be an excellent idea to give it a pretty good test on a small scale in a good many localities. Of course, it will not pay for the honey alone; but if it will pay for the hay, even though we should have to irrigate during a severe drouth, it may thus indirectly be of great value to our industry.

JAPANESE BUCKWHEAT, AGAIN.

SINCE my Special Notice on page 970 was put to press, still larger lots of Japanese buckwheat have been offered us in such quantities that the best offer we dare make at present writing (Nov. 29) is 50 cents per bushel, of 50 lbs., in cash, or 60 cents in trade, delivered here. This is for nice clean seed, suitable to sow. We do not know how long we can keep even this offer open, nor can we at present state definitely what will be our selling price. It will depend upon how much is sent in at the above figures. Truly the Japanese buckwheat is one of the greatest improvements, in a single line of grain, of the present age. All other kinds of buckwheat can well be thrown aside; and not only the bee-keepers of our land, but farmers in general, can unite in tendering a vote of thanks to our enterprising seedsman, Peter Henderson. Buckwheat flour, first quality, York State, is now offered in the city of Cleveland at \$2.00 per cwt.

FALSE STATEMENTS.

THERE are quite a good many who hold persistently to the idea that comb honey is manufactured; and I am sorry to see in some of the papers the absurd statements about artificial eggs still given. When we remonstrate, a good many say that more wonderful things than making artificial eggs and artificial honey-comb are being done every day. True; but, my dear friends, the great progress that is being made in the arts and industries is not in line with fraud at all. It is the reward of honest, faithful, and persistent work. The man who dares to perpetrate a fraud upon humanity, especially in the line of food products, is bad and

unprincipled; and it would be a sad thing indeed, if it were true, that God blesses frauds in that line, as he does in the line of honest investigation. The Bible says, "Blessed is the man that walketh *not* in the counsel of the ungodly." It also says, further along, in speaking of the same man, "He shall be like a tree planted by the rivers of water; and whatsoever he doeth shall prosper." Now, the progress of the 19th century has not, and never will, set these old Bible teachings aside; on the contrary, if we look carefully we shall find it is exactly in a line with them.

MAILING BEES BY THE POUND.

WE notice that friend Doolittle considers the matter practicable, and defends it. In the *American Bee Journal* for Nov. 16 he enumerates some of the benefits that would accrue if it should be accomplished. Now, I think I can see more important results, even, than he mentions, if this were possible. A great many people of limited means ask the question, "How cheap can I get a start in bees?" Some boy or girl, or perhaps a widow of small means—one who has leisure, and who has become greatly interested in the industry, would like to know if a start could be made by getting a queen-bee and a few attendant bees by mail. Again and again we explain to them that it is impossible. Then comes the question, "If they order by express, what will the express charges be?" Very often, more than the bees and queen. Now, then, if half a pound of bees could go along with the queen, \$2.00 would cover the cost of the start, transportation and all; and from this investment of \$2.00 a whole apiary might be built up; for with careful management during the month of May or June a queen and half a pound of bees could be built up to a good colony, and that, too, without any comb or brood. May be it could be done with a quarter of a pound of bees; but it would, perhaps, be a little doubtful. I thought of this years ago—yes, when I first commenced sending out little swarms of bees in the wire-cloth basket; but I have always finally decided, as I do now, that no kind of cage can be made, stout enough and still light enough, to make it safe to risk by mail, as there is so much throwing and banging, the way our mails are handled. I am, however, open to conviction.

SEEDS OF HONEY-PLANTS.

THE trade in these has dropped off greatly. In fact, it has been dropping off for two or three years past, and I am very glad of it. It really gives me pain to get a letter from a beginner in bee culture, indicating that the writer has an idea that, because he has half a dozen colonies of bees, he must "plant something" in his garden so as to furnish honey for them. Quite a few seedsmen have been encouraging this idea, prominently among them being Mr. Samuel Wilson, who has recently recommended and brought out under a new name our old well-known spider plant. Every effort that I know of, to raise plants *exclusively* for honey, has failed, and I think must fail. If you have only half a dozen colonies you need at least an *acre* of the plant in question to do any good. Now, if said plant gives you a profit for seed or for hay, aside from what honey it furnishes, well and good; but please do not plant an acre, or even a little patch in the garden, *exclusively* for honey. If you can arrange with the farmers around you to grow buckwheat, alsike, or rape, well and good; for an acre of these may be

worth four or five dollars to you. At the same time, it *may not* benefit you at all. If circumstances are such that you can not plant your bees beside a field of a *hundred* acres of buckwheat or alsike or rape, or even teasel, there is quite a chance that you may get honey by the ton, from these sources alone; but if instead of a hundred acres you say a thousand, then there is a chance for something worth while; and our friends in Nevada, Arizona, and other western points where alfalfa is raised by means of irrigation, are doing just this very thing. If sweet clover could be made use of for some purpose besides the honey it furnishes, there would be a possibility of profit in that direction; but I do not see how anybody can raise sweet clover or *any thing else*, simply for the *honey* it furnishes, and get his money back.

SPECIAL NOTICES.

ADVANCE IN WIRE NAILS.

Owing to large advance in cost of raw materials, we have to pay higher prices for wire nails. There will be no change in the 1 and 10 lb. rates, but we can not sustain the 25 and 100 lb. rates in our catalogue.

ALSIKE AND WHITE DUTCH CLOVER.

If any of our readers have for sale any choice seed of alsike or white Dutch clover, will they please send us small samples, and say how much they have, and what they want for it? We are entirely out of white Dutch clover, and should like some of that as soon as we can get it.

ADVANCE IN PRICE OF TIN.

Tin plate has already advanced about 50c a box on 14 x 20 size, and at the same rate for larger sizes. The prices don't seem inclined to stop advancing yet. We were fortunate in having contracted for most of our supply for next season before the advance, and therefore we will ask no more than our catalogue price at present; but we can not discount these prices for early orders.

VANDEUSEN SPACING IRON CORNERS.

These corners were illustrated in GLEANINGS, page 514, 1889, and a number of readers have inquired where they could get them made for 1½-inch spacing, the original corners being made to space 1½ inches. We are at present working on a pattern, and expect soon to have corners to offer for sale that are made to space 1½. As soon as we have them ready we will mention it in this department, giving the price.

ANOTHER REDUCTION IN THE PRICE OF WIRE NETTING.

We omitted to mention, in last number, that you would find on the last cover page of our premium list our new and reduced prices on poultry-netting. We are now selling a single bale at the same rate as we sold 10 bales, which, for 2 inch. No. 19, 4 ft. wide, in rolls 150 ft. long, is \$4.00 per bale; 5-bale lots, \$3.75; 10-bale lots, \$3.60. We make this big reduction, too, in spite of the recent large advances in the cost of steel and wire goods.

JAPANESE BUCKWHEAT.

In my plea for seedsmen, in our issue for Nov. 1, I tried to tell you why they should have a good margin for their seeds. Well, we are just now pretty well stocked up with a great lot of Japanese buckwheat that cost us over a dollar a bushel. We thought that it would certainly be safe to lay in a good lot at that price; but we now find that the supply is so great that we should be very glad indeed to close it out for a dollar a bushel, you to pay for the bag. A good-sized bag, suitable for shipping two bushels of grain, is worth 20 cts.; one bushel, 15 cts.; half-bushel, 10 cts. Of course, there may be a reaction; therefore, if you want to avail yourself of this offer, you must take it between now and the first of January.

Sturwolds' Show-Case

FOR THE PROTECTION AND DISPLAY OF HONEY.

In well-equipped retail stores you will find many goods displayed in show-cases. This is because, from their nature they are liable to damage from dust, exposure, and frequent handling. What is more worthy a place under glass than our honey? By adding to its attractiveness it calls the attention of more people to it, and thus increases its sale. We have just made a new lot of cases, similar to the one shown above. We have used chestnut instead of walnut, and have improved the construction of the case so as to make it stronger, lighter, and simpler. To save transportation charges we can finish these all up and then take out the four corner standards and ship "knocked down" and securely boxed. They will thus go as first-class freight, while put up they charge three times first-class rates by freight. By express there would be no difference. Price of the case, put up with glass in, or boxed separately, or knocked down and boxed any of the three ways, will be the same—\$4.00. With name and address on the front glass, \$4.50.

A. I. ROOT, Medina, Ohio.

TYLER'S FLOUR-RECEPTACLE

A MUCH-NEEDED HOUSEHOLD CONVENIENCE.

This is the most convenient arrangement for flour that we have ever seen. It holds just a 49-lb. sack of flour. It is to be hung on the wall just above your table. When you want some flour simply place your pan under it, open the lid on the bottom and turn the crank and you get your flour already sifted. It is simple, neat, and effective, and not expensive either. Price \$2.75 each, crated ready for shipment, or giving

free for 8 subscribers, with \$8.00.

T., Medina, O.

LITHOGRAPH LABELS

In 12 Colors, at \$2.00 per 1000.

The 12 colors are all on each label. They are oblong in shape, measuring 2½x3½. They are about the nicest labels we ever saw for glass tumblers, pails, and small packages of honey. We will mail a sample, inclosed in our label catalogue, free on application, and will furnish them postpaid at the following prices: 5 cts. for 10; 35 cts. for 100; \$1.20 for 500; \$2.00 for 1000.

A. I. ROOT, Medina, O.

KIND WORDS FROM OUR CUSTOMERS.

I unpacked the barrel and crate to-day, and found every thing in place. Your work fits, to a gnat's heel. The freight for both was only 67 cts., which strikes me as very moderate. By mixing up the Dove-tail and Simplicity, I can make a hive to suit myself at least.

A. T. GOLDSBOROUGH.

Washington, D. C., Dec. 5.

Last spring I sent to you for "First Steps for Little Feet," as a birthday present to our youngest son. You ought to have seen that happy face. He has read it through several times. Please send me the "Story of the Bible." It is a birthday present to our oldest son. He will be 16 the 4th of August.

A. SHIFFLER.

Roseland, Neb., July 17, 1889.

THAT DOLLAR QUEEN, AND HOW SHE EXCELS ALL OTHERS.

That dollar queen I got of you last year is producing the best workers I have. She and her daughters gave me 140 lbs. of extracted honey per colony; the rest of my bees averaged 80 lbs. per colony. They seem to be always at work when the rest keep at home.

F. H. THIELE.

John's Pass, Fla., Nov. 4, 1889.

THAT QUEEN TO OREGON, IN A BENTON CASE.

The untested queen sent me was received Oct. 1, just seven days en route. She was a beauty, and just as smart as a cricket. I introduced her without much trouble; I fed a little for a night or two, to stimulate laying. On the 21st she had brood in all stages, and yesterday I noticed a fine lot of young Italians out taking a play; so you see I am well pleased with my queen.

A. A. MORRILL.

Glenwood, Ore., Nov. 15, 1889.

LETTER FROM MINNIE CHADDOCK.

Dear Friend:—We received a card last week stating that there were five dollars due us for our dear mother's writing, and that you would send GLEANINGS this year if we would accept. There is no "if" in the way; we accept heartily—would be lonesome without it. My brother Irving will take charge of the bees; and as he has had very little experience, will need GLEANINGS very much. Thank you for all your kindness to us.

Vermont, Ill., Dec. 10. MINNIE M. CHADDOCK.

PLEASED.

We owe you our sincere thanks, and know of no better way of expressing ourselves than to tell you how we have succeeded in the bee-business by following your directions in the A B C of Bee Culture, and using your style of hive, the Simplicity. Last spring we bought two colonies of bees in American hives, for which we paid \$6.00. In July I found a bee-tree, and saved the bees. I transferred them from the tree into a nice clean Simplicity hive, and they filled the lower story full, and made 50 lbs. of surplus honey. We have increased from the two old colonies to eight in all. Three of the new ones have two swarms in each hive. That is how they did in the way of swarming. Now as to honey: Every colony has the lower story of its hive full of honey, and all are in fine shape for going into the winter. They made, of surplus honey, 200 lbs. in one-pound sections. All the above was done with two colonies, with the aid of one more after the first of July. We owe our success to you for the good advice you give us in the A B C book, for which we tender our sincere thanks.

Jamesport, Mo., Dec. 5, 1889.

C. K. GWINN.

A No. 1 EXTRACTED HONEY, CHEAP.

Send for New Prices.

JAMES HEDDON, DOWAGIAC, MICH.

FOR SALE.

A well-established apiary business, located in the best section of Iowa. Established ten years. Good trade. Building located on main street; for \$500.00. A bargain. Also 50 stands of bees, in good "L." hives, at \$4.00 per stand. Reason for selling is age, and other matters requiring my attention.
E. W. COE, Clarence, Cedar Co., Iowa.

ODD BUT TRUE.

Send me the names of 10 regular subscribers to the American Agriculturist, or Ladies' Home Journal, and I will give you next season your choice of the following: 1 untested Italian queen, 13 Laced Wyandotte eggs, 13 B. Leghorn eggs, or 10 S. S. Hamburg eggs. All I want is the names of 10 persons who take either of the papers. Write for catalogue of nearly 2000 papers at reduced rates.

HONEY COLUMN.

CITY MARKETS.

NEW YORK.—*Honey.*—Our market has been inactive for the past month, and the demand for comb honey has been light in consequence of the unusual mild weather, with prices gradually declining. We quote: Fancy white 1-lb. sections, 13@14; 2 lbs., 12; off grades, 1 lbs., 11@12; 2 lbs., 10@11; buckwheat, 1 lb., 10@11; 2 lbs., 9. Extracted is in good demand at the following prices: White clover and basswood, 7½; California, 7½; orange bloom, 8@8½. Buckwheat, 6; Southern strained, 7@7½ per gallon.
Dec. 6. HILDRETH BROS. & SEGELKEN,
28 and 30 West Broadway, N. Y.

CHICAGO.—*Honey.*—Trade is slow at this writing, and the last week's sales are not as good as those of the preceding week. The falling off in sales during December compared with same time in November, is forty per cent. Prices are nominal, at 12@13 for best grades, to 14 for fancy in cartons; off grades, 10; dark, 8@10; extracted, 6, 7, and 8. *Basswood*, 25.
Dec. 9. R. A. BURNETT,
161 South Water St., Chicago, Ill.

KANSAS CITY.—*Honey.*—Honey selling slow; don't look for much improvement in the demand until we get colder weather. We quote: White 1-lb. sections, 13@14; amber, 10@12; white, 2 lb., 12@13; amber, 10@11. Extracted, white, 7@8; amber, 5@6. *Beeswax*, 22.
Dec. 9. HAMBLIN & BEARSS,
514 Walnut St., Kansas City, Mo.

COLUMBUS.—*Honey.*—Market on honey dull. White clover brings 14@15 for fair grade. Nothing but first-class goods find sale. Extracted honey meets with ready sale at 8@9. Market about cleaned up on that class of goods. EARLE CLICKENGER,
Dec. 10. Columbus, O.

BOSTON.—*Honey.*—We quote fancy 1-lb. white clover honey, 16@17; fair to good, 15@16; 2 lbs., 15@16. *Beeswax*, 24.
Dec. 9. BLAKE & RIPLEY,
57 Chatham St., Boston, Mass.

ALBANY.—*Honey.*—Market quiet and unchanged. Clover, 12@15; buckwheat, 10@11; mixed, 10@12. Extracted, clover, 8@10; buckwheat, 6@7.
Dec. 10. H. R. WRIGHT, Albany, N. Y.

CLEVELAND.—*Honey.*—Market easy. Best white 1 lb. sections sell slowly at 13@14.
Dec. 9. A. C. KENDEL, Cleveland, O.

DETROIT.—*Honey.*—Comb honey dull and lower; now quoted at 12@14. Extracted, 7@8. *Beeswax* firm at 24@25.
Dec. 9. M. H. HUNT,
Bell Branch, Mich.

NEW YORK.—*Honey.*—White comb honey, paper cartons, 13c. Market flooded.
Dec. 10. THURBER, WHYLAND & Co.,
New York City.

FOR SALE.—White basswood honey, 8 cts. per lb.; dark, 6 cts. My honey is all put up in barrels, kegs, and pails, made of basswood lumber. The pails are painted, and have bails. AUSTIN DEXTER,
Boscobel, Wis.

FOR SALE.—About 2500 lbs. No. 1 clover honey in 60-lb. cans. F. O. B. here at \$4.80 per can, boxed singly. In kegs or large lots, less. R. L. TUCKER,
Nevada, Vernon Co., Mo.

FOR SALE.—I still have about 4000 lbs. choice extracted white-clover honey. I have also about as much nice Spanish-needle honey, which I consider as fine as the best goldenrod. Write me for price list. EMIL J. BAXTER, Nauvoo, Hancock Co., Ill.

FOR SALE.—Choice clover comb honey in 14-oz. sections, and glass cases of 12 lbs. each, net, 2 cases, 14 cts. per lb.; 12 cases, 13 cts. Amber honey, same shape, one cent less. Cheaper packages, ¾ ct. less. Extracted, 60-lb. cans, white, \$4.80; amber, \$4.20 per can. Safe arrival guaranteed.
OLIVER FOSTER, Mt. Vernon, Ia.

A BARGAIN.—Sixteen colonies of hybrid bees in L. hives, in good condition. Delivered at Horn Lake, for \$35.00, or offers. Correspondence solicited.
J. R. ELMORE,
Horn Lake, Desoto Co., Miss.

WANTED.—To exchange Spider plant, Catnip seed, Turner, Mammoth-cluster raspberry, plants, for Japanese buckwheat, bee-books, or offers.
G. M. WHITFORD, Arlington, Neb.

SPECIAL NOTICES.

DISCOUNTS FOR EARLY ORDERS.

Remember that the 3 per cent discount for early orders is changed to 2 per cent Jan. 1, 1890.

JAPANESE BUCKWHEAT.

We cancel all former offers on Japanese buckwheat by this one, 40 cts. cash or 50 cts. trade, per bu. of 50 lbs. choice seed, delivered here. Extra for bags to ship it in.

FABLES AND ALLEGORIES.

This book, illustrated in our premium list, is a magnificent volume, gilt title and gilt edge. Nothing is nicer for a Christmas present. The publisher, in closing out this particular style, gave us a very low price, and we offer them to you at \$1.50 each, or by mail for \$1.80.

COMB AND EXTRACTED HONEY.

We have a large stock of both comb and extracted honey that can not be excelled in quality. If any of our readers are wanting honey, write us for prices naming quantity you can use. We offer the comb honey, 24 or 42 sections to the case, net weight about 23 and 36 lbs. respectively, at 16 cts. per lb., 1 to 5 case lots. Extracted clover or basswood in 60-lb. sq. cans, 2 cans in a case, at 9 cts. a lb.; in 550-lb. barrels, at 8 cts.

TWO MORE BOOKS BY THE AUTHOR OF THE STORY OF THE BIBLE.

We have just put in stock the two following books, which will make excellent additions to any library, public or private. The *Story of Bible Animals*, by J. G. Wood, is just the same size as the *Story of the Bible*, 704 pages and 300 illustrations. It is a description of the habits and uses of every living creature mentioned in the Scriptures, with explanations of the passages in which reference is made to them. Price \$1.50, postpaid, or \$1.30 by freight or express with other goods.

Bible Pictures, and What They Teach Us, is a handsomely bound book, 8½x10 in size, 232 pages, 312 illustrations, with descriptions by Chas. Foster. An agent, who has had large experience in selling books of different kinds, says none sell as readily as this. Price \$1.50, postpaid. Parties wanting a quantity will please write us for prices.

MANUAL OF PHONOGRAPHY, AND OTHER GOOD BOOKS.

It is not alone garden-seeds, but a good many other things, that lie on our shelves and get out of date, if we don't look out. By "we" I mean us store-keepers. We found in our vault, where we keep our books, 20 copies of the "Eclectic Manual of Phonography," by Elias Longley. Our stenographer says these are admirable helps in this branch of phonography, which is known the world over as Pitmanic. Now, the price of the books is \$1.00, and I think they cost us 75 cts.; but if anybody wants one he can have it for 40 cts. If sent by mail, 6 cts. extra. The book was published in 1882.

We also have 40 copies of W. W. Rawson's little book, "Celery and its Cultivation." We regard it as the best authority, and I have taken pains to read carefully all of the pamphlets that have been published. By some mistake they received only an editorial notice, and never got into our catalogue. The price is 15 cts.; by mail, 16. It tells all about putting up celery for winter.

There is just one more book that does not sell—Household Conveniences—published by O. Judd & Co. The price is \$1.40; by mail, \$1.50. The book is full of valuable illustrations, and it ought to make a beautiful present for any housekeeper. Do you know any housekeepers around in your neighborhood? Well, you may have the book for an even dollar; by mail, 10 cts. extra.

Vol. XVII.

DEC. 15, 1889.

No. 24.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single number, 5 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

Established in 1873.

PUBLISHED SEMI-MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries of the Universal Postal Union, 18 cts. per year extra. To all countries not of the U. P. U., 42 cts. per year extra.

WORKING FOR COMB HONEY.

DOOLITTLE ANSWERS A PECULIAR QUESTION.

THE following has been sent in to me as a text from which to write an article for GLEANINGS: "How to manage a home apiary of 50 colonies for comb honey, in connection with another business, said business to occupy the apiarist's time from 7 A. M. to 6 P. M. Increase desired, 30 colonies, or the apiary to contain 80 in the fall. Hives, eight-frame Simplicity." This is a good deal of ground for me to cover in the space allotted for one article, but I will do the best I can. We are also to understand that the source from which a surplus of honey is gathered is only white clover and heart's-ease, other flowers yielding enough for brood-rearing in good years. Now, we will suppose these bees to be in fair condition in early spring, which, according to my definition of that term, would be about 10 colonies extra good, 20 colonies from good to medium, and the remaining 20 from medium to weak. As white clover is the thing we are to keep our eyes on for the main crop of white honey, we must have our bees ready for it as early as the tenth to the fifteenth of June, or we lose this part of our field. Considering this, I should, in early spring, shut the bees of all the colonies, except the 10 strongest ones, on as few frames as they would cover, allowing none of those so contracted to have more than five combs, while the very poorest would probably not have over two. This contraction is done by the use of a division-board; and if, in addition to this, we have chaff or sawdust cushions to slip down and fill the space behind the division-boards, we are so much nearer accomplishing our object (a good yield from clover) than we should otherwise be, for the confining of the heat generated by the bees to the space occupied with brood gives us much brood

early in the season. As soon as the strongest of these contracted colonies have their five frames filled with brood, take a frame of hatching brood from them and give to the next weaker, and so on till each hive has five frames filled with brood, as you are to give a frame of empty comb each time, to the colony that you take the hatching brood from. If you have been as successful as you should be, when the 10th of June arrives you will have 10 hives in the apiary having 8 frames of brood, for the stronger will have filled their hives by this time, and 40 hives with 5 frames of brood. We will now go to each of 20 hives and take out 3 frames having the most brood in that is the nearest to hatching, being careful not to get the queen on any of these frames, and set them, bees and all, into the other 20 hives which contain only 5 frames each, alternating them with the other frames so the bees will not quarrel. Having this done, we shall find that our apiary now stands, 30 hives full to overflowing with brood, and 20 hives with a queen and two combs full of brood, with bees enough to cover three frames, when the old bees return which we carried to the other 20 hives, which they will do the first pleasant day after we united them with the others. We now give each of these 20 small colonies an empty frame having a starter of comb foundation in it $\frac{1}{2}$ inch wide to keep them busy, which will be filled with worker comb by this small colony, as such colonies will build all worker comb, and do it without any apparent loss of time. The other colonies are to have the sections put on, so that the very first honey which comes from the field can go into them; and it must go into them, if honey is gathered, for the brood below hinders them from putting it elsewhere. As to the surplus arrangement used, I do not think there is very much difference whether a T super is adopted, wide frames, or the Manum, or Heddon case, only

that you use that which is best suited to your hives. If a cap, half-story cover, or hood, as it is variously styled, is used, then I would use one of the three first-named surplus arrangements; while if I used a flat cover I would use something similar to the Heddon case, if not that one.

Having the full colonies all boxed, and the bees well at work in the sections, they should be watched closely, to the end that they do not become crowded for room; for if they do, swarming will be brought on sooner than it otherwise would, and we desire to get the bees started in as many sections as possible before they swarm. As soon as they need more room, tier up the sections, by placing a set of empty sections filled with thin comb foundation on top of the first set (if the questioner used chaff hives, I would say use wide frames and the lateral plan which I have lately given in GLEANINGS), and so keep tiering up as long as the bees show no signs of swarming. When it is expected that they will swarm, the apiarist, when he gets home some night at six o'clock, is to go to such hive as he thinks will soon swarm, and set it from its stand, placing an empty hive in its place, which hive is to contain only five frames having foundation-starters in them, *a la* Hutchinson, the rest of the space being contracted with dummies. The surplus arrangement is now to be lifted off the old hive and placed on the new, when all the bees are to be shaken off the brood combs, and out of the old hive, in front of the prepared new hive, into which they will immediately run, when swarming is over with for that hive. The combs of brood are to be taken to the hives having the small colonies in them and given to those which can care for them best, giving none over three combs at a time. In this way keep on till all the colonies are "swarmed," when swarming will be through with for the season, for if properly managed in the heart's-ease bloom they should not swarm thus late in the season. As there will be more brood in the 30 strong colonies than you can put in the 20 weak hives, colonies are to be made from those whose hives were first filled out with brood, by taking one frame with adhering bees from each of 8 hives and setting them all together in one hive, and giving a queen, thus making a strong colony at once by the old plan so often given. In this way you make room for the rest of the brood and obtain the 30 increase desired. As soon as each hive is full of brood, these too are to have sections put on them, so that they may help swell the amount made by the stronger ones. When the harvest of white honey is over, take the dummies out from those hives having only 5 frames in them, and fill out with frames filled with foundation, so that lots of brood can now be reared to work on the heart's-ease later on when the surplus is to be obtained from this source. In this way we secure all the honey possible from the white clover by having the laborers in shape for that harvest; make our increase in a way and at a time so as to interfere the least possible with our crop, and get our bees in good shape for the fall crop and for winter.

Borodino, N. Y., Dec. 4, 1889. G. M. DOOLITTLE.

Very good, old friend. Had not our querist put in so many conditions, we might have differed from you a little; but as it is, I think you have it about right. When I used to keep bees, and could see them only morning, noon, and night, I adopted a good

deal the routine you mention. Where the apiarist can be on hand all the time, I think I would not swarm any of them until they swarmed themselves; but where he can not attend to that, perhaps the best way to avoid swarming is to take it into our own hands, and decide as you suggest.

THE INTERNATIONAL BEE-ASSOCIATION AT BRANTFORD.

ON THE WAY AND WHILE THERE, AS REPORTED BY ERNEST.

WE (myself and better half) started on the evening of the 3d for Brantford. With the other necessary baggage, I took along my Anthony Detective camera that I might take some views of the Falls, and also a view or two of the bee-keepers' convention. I had heard that amateur photographers had experienced some difficulty in getting their instruments over into Canada, even when they were for their own use. Accordingly, I inquired concerning the matter, at the Bureau of Information, at the Erie depot, at Buffalo. Said the agent, "Put on a brazen face, and make no effort to conceal the camera, and I'll guarantee you'll have no trouble."

On arriving at the Suspension Bridge at the Falls, I did as directed, "brazen face" and all. My camera and contents were worth about \$50.00; and the duty, if demanded, would amount to one-fourth, or over \$12.00. The custom-house officer inspected our sachel, and then, glancing at my camera, said, "What do you call that?"

"A camera. It is one I have had a couple of years, and I should like to take some pictures in Canada."

Said he, in a very gentlemanly manner, "It's subject to duty. While I should be glad to make an exception in your case, I am acting under the instructions of the government of Canada."

"Can't I leave it somewhere?"

"Yes," said he, "in the Custom-House office."

"But," I said, "you people will put me to considerable trouble in getting it out again. There is a lot of red tape in this business."

He assured me kindly, that on the presentation of my name on my return I could have it. With some misgivings I accepted what I could not help, and surrendered my instrument into the hands of the officer.

The train pulled out, and ere long we reached Brantford. We went immediately to the Kerby House, where special rates to bee-keepers, at \$1 50, had been secured, the regular price being \$2.00. By way of a parenthesis, I want to say that I have been to several three and four dollar houses, with no better (if as good) accommodations in the United States. Most of the bee-keepers, as a matter of course, took lodgings there.

The first person I met was Frank Macpherson, of the D. A. Jones Co., of Beeton. Frank and I, you know, had a little—well, argument—respecting the place of meeting for the last session of the American Bee As-

sociation; but that did not lessen the friendly grip of the hands, and the cordial greetings.

It was with no little pleasure that I made the personal acquaintance of that scholarly gentleman, Mr. S. Corneil, of Lindsey, and that prince of Canadian honey-exhibitors, Mr. R. McKnight, of Owen Sound.

I met many others, whose faces and names I could not remember, but whose greeting and friendship I appreciated no less.

Contrary to my expectations, there was a large attendance of bee-keepers at all of the sessions. While it was largely local, yet there were a good many from the United States and the more distant points in Canada. The Ontario Bee-Keepers' Association was well represented. The total number in attendance was in the neighborhood of 125; but not all of these were registered members. As a detailed report of the proceedings will appear in the *American Bee Journal* and other journals, I will not attempt to give even a summary of all of the interesting papers and discussions. I will only pick out here and there some of the things as they stick on my memory.

The president's address was a valuable contribution. It rehearsed the year's progress in apiculture, and was full of suggestions. I was sorry that it came close to the adjournment of the session, so that some of the things brought forward might be discussed. Somehow it was overlooked at the next session, for the president was too modest to bring it up himself.

The convention gave rather more attention to the subject of wintering than I thought was necessary or expedient. But one fact I noticed was, that there was less conflicting testimony on the subject than usual, and this is encouraging, for it indicates that this perplexing subject is gradually reaching a satisfactory solution. It was quite generally agreed, that bees *could be* successfully wintered outdoors packed in chaff, and that, while less skill is required, a larger consumption of stores is the result when compared with the indoor plan. Mr. G. Sturgeon, however, of Kincardine, after trying both ways, now uses the Root chaff hives exclusively, and winters very successfully every year; and, if I remember correctly, he said with no larger consumption of stores. As for cellar wintering, sub-earth ventilators were considered a useless expense. If they serve to lower the temperature, they answer a good purpose; but this result could be accomplished cheaper by opening doors or windows at night. It was decided that artificial heat is not only useless, but positively injurious. Roaring in the cellar does not indicate a desirable condition of the bees. Just how to stop it is not an easy thing to settle. Some interesting tables as to the minimum consumption of stores in cellar wintering were given in a valuable paper by R. McKnight, of Owen Sound. If correct, the rate of consumption per hive while in the cellar is astonishingly low. Corroborating testimony from others present was given.

When the subject of bee-keeping for wom-

en came up, there was not a uniformity of opinion. Considerable stress, however, was laid upon the point that bee-keeping is suitable for women, providing they could now and then call upon the men-folks to assist in the heavier work. The opinion did not seem to prevail that bee-keeping is a light occupation.

Shipping queens was considered by F. H. Macpherson, of the *Canadian Bee Journal*. He emphasized the point of putting up queens a few hours before shipping, and keeping them in the meantime in a dark place. For material for queen-cages, he prefers pine. He also said that too much ventilation is very often given. After Mr. Macpherson's paper, I brought up and explained the Benton cage. The great point in its favor is its almost universal success in shipping queens long distances. Considerable corroborating testimony was brought forward to this effect. Some queens, after a journey of forty days, have been found in most excellent condition, in this cage.

Warm hives, and how best to obtain, was discussed in a very able manner by Mr. S. Corneil. The relative values of packing materials, as determined by careful experiment, was given, and the result was in favor of pulverized cork.

One of the rare treats of the convention was the reading of a paper on the alimentary system or apparatus of the honey-bee, by Prof. Cook. The paper was illustrated by drawings, to which the professor referred frequently. I hope we may be able to present this, or something similar, to our readers, in a short time, accompanied by some good engravings. That most beautiful mechanism, the bee's tongue, and the manner in which it draws up honey under different circumstances is wonderful. It is something that every bee-keeper ought to have more or less knowledge of.

Bee-keeping as a hobby was the topic of a paper by your humble servant. I took the ground that every one needs some recreation. As I have been a rider of many different hobbies, I touched briefly on each, and decided most emphatically upon bee-keeping. In my paper I alluded to the fact that driving a good colt has been one of my hobbies, and that I had ridden this hobby so hard that I have been through a literal runaway on two occasions. After I had finished, Mr. R. L. Taylor took the floor, and made this very neat application: Hobby-horses are good things, but they are dangerous. We should be careful not to let our hobby-horses *run away with us*. He thought many of us would have made more money if we had let hobbies alone and given our whole time to business.

Our friend W. F. Clarke made another application upon hobby-horses, which I thought was far-fetched. He said that his friend A. I. Root was riding a hobby a little too hard over other people, and that was his tobacco hobby in the shape of the Tobacco Column in GLEANINGS. He did not approve of the plan of giving out smokers. He thought Mr. Root was pushing the matter a little too hard. Although a minister of the gospel, Mr. Clarke said that he uses tobacco, and

that he smokes it to the glory of God; and although he at first opposed its use, his brother and a physician advised him to use it, and he says he has since derived great benefit.

President Mason then took the floor, and remarked that a good many tobacco-users are riding their tobacco hobby-horses right in the *very faces* of the people who do not use it; that is, the tobacco-users *compel* other people to breathe in their offensive smoke, and to inhale tobacco odor. This was, he thought, a clear case of riding hobbies over other people. As to the matter of life or death, tobacco or no tobacco, the doctor thought that, if he had got to choose between a prolonged life *with* tobacco, and death and *no* tobacco, he would get ready to die just as soon as he could. He did not exactly approve of giving out smokers as a pledge.

Continued in next issue.

GOLDENROD

HOW TO GET THE WHITE HONEY, AND GIVE THE
BEES THE INFERIOR ARTICLE.

FRIEND ROOT:—On page 815 I mentioned extracting the crop of late summer honey, mostly peach and bitterweed, about Sept. 6th. It was to test what the goldenrod and aster yield would be, with the view, next season, of taking off that crop of second-rate honey in sealed combs, and substituting empty combs for the choice fall crop, then returning the sealed bitterweed combs for the bees to winter on.

On going through, and getting things in shape for winter, I find about as much choice honey in the hives as I extracted of second-rate in September. So it looks as if this late fall crop were worth trying for. If I should extract much of it now, however, I should have to feed back a considerable amount of extracted bitterweed, which is now very thick, and candying. Robbers would be troublesome, and any day may bring a cold snap; so I think they may keep most of what they have. But another season, will it not pay to have the extra combs ready, and try the plan outlined? Keeping the sealed combs of bitterweed honey free from moth depredations will be the chief drawback. I should be glad of some light on this late fall-crop business if any of your Southern readers have tried it.

GETTING RID OF STUBBORN FERTILE WORKERS.

An experience with a colony having a fertile worker may be of some interest. I recently purchased two Italian queens to introduce into two black-hybrid colonies. One was accepted, the other was killed; both were in Peet cages, and escort bees had been taken out before fixing the cages on the combs. Going away to assist a friend in introducing a lot of queens, I left my two to take their chances; and returning I found one dead before the entrance, the other laying. Both hives had had queens up to the time of introducing the new ones. Taking out all brood, unsealed from the hive now queenless, I gave them Italian brood, hoping in this way to get a purely mated queen, as I found the only drones flying were from a choice Italian colony. The bees would not even care for this brood, but carried it out. I then gave another comb, thinking the first might have been chilled. This brood they

raised "a la worker," but no queen-cells were started. By this time the few eggs scattered about, sometimes two in a cell, told "what was up." So, to demoralize the whole thing, they were all shaken out in front, and allowed to crawl back, two frames of brood and bees having been inserted. Again no go, when I hit upon this plan: There was a strong colony, not far off, in a two-story hive, both stories full of bees. Making sure their queen was below, I took the upper story and "swapped" it for my fertile-worker colony (one story), which left the bogus queen in the second story of a colony having a queen. Of course, most of the old bees of both hives went back to their respective homes. The stores were about equal. I then gave more Italian brood to my queenless colony, and queen-cells appeared in due time. There was no fighting in either hive.

C. P. COFFIN.

Pontotoc, Miss., Oct. 21, 1889.

McNAY'S TABULATED REPORT

IN REGARD TO THAT LARGE YIELD.

Mr. Root:—In compliance with your request I herewith inclose a tabulated record of our season's extracting, from six apiaries. I trust the table will be understood by referring to my report on page 806, GLEANINGS, Oct. 15, without further explanation.

	Apitay A. 4 miles from basswood, 35 colonies.	Apitay B. 4 miles from basswood, 40 colonies.	Apitay C. 4 miles from basswood, 50 colonies.	Apitay D. 1½ miles from basswood, 35 colonies.	Apitay E. 5 miles from basswood, 50 colonies.	Apitay F. ½ mile from basswood, 70 colonies.	Apitay G. ½ mile from basswood, 70 colonies.

BEE-HUNTING IN THE SIERRA NEVADA MOUNTAINS.

BY A SUCCESSFUL BEE-KEEPER.

Continued from last issue.

IN the spring of the year, bees prefer salt to honey; and using salt and water instead of honey, works first rate. Toward the latter part of the season, bees pay no attention to salt, but are crazy after honey. The breeding season is about ended, I suppose, and they have no more need of salt.

Some varieties of trees are more frequented by bees than others. This is owing, probably, to the large cavity these trees contain. In this location most bees construct their hives in sugar pines and firs. Old trees of the fir family are usually dead at the top, and sometimes broken off, caused by winter snows and winds. Trees thus broken off, usually send out a number of young shoots which grow up parallel with the main axis of the tree. Trees that are hollow within, usually give some outward signs of such defect, such as dead tops, the end of the branches dead, etc. When oak-trees are divested of their foliage in the fall of the year, is a good time for hunting bees where oak timber abounds. When saving bees, oak-trees are the best, as they can generally be felled pretty easily. When there is four or five feet of snow on the ground, that is the best time to cut the larger trees, as they do not fall so heavily.

HUNTING BEE-TREES WHEN SNOW IS ON THE GROUND.

I usually have as good success in hunting bees in the winter as in the summer time. When the ground is covered with snow, and the bees come out for a fly-spell, a great many become chilled, or snow-blind, I do not know which, and the snow around the tree is generally covered with dead bees. In running over the mountains in the winter time, on snowshoes, we frequently find bees on the snow. Marking the location, we return some warm day and find the tree. On Jan. 1, 1887, we found and cut a bee-tree. The bees were working on the black alders, in great numbers. I filled five L. frames with brood, and two with honey. That was an immense swarm of bees for that season of the year. I have taken bees out of trees almost every month in the year, and generally have pretty good success.

My method of taking bees from trees is as follows: After getting the tree opened, take all the combs containing brood, and cut each piece of brood so it will fit securely in the frame. With small wire nails, tack securely four small strips on the frames thus: Incline your hive to one side, and set in your frames as soon as filled. When you have all brood and empty comb in the frames, and your hive inclined to one side, so there is no danger of combs tumbling down, you will be ready to put the bees in the hive. Wait until they get clustered together, then lay a piece of cloth underneath them, and, with a small brush, drive all the bees off, causing them to drop on the piece of cloth. Shake the cloth in front of the entrance, and the bees will soon commence to call for their comrades. Put about half of the bees in this way, and the remainder will go in of their own accord. After they have been in there a few days you can remove them to their permanent location;

and if the weather is pleasant, and they have had a chance to fly out, you can take out the frames and remove the small strips, tacked to one side.

DISTANCE BEES GO FOR STORES.

Black bees rarely if ever go over one and a half miles for stores in this mountainous part of California. I suppose that, in a level country, they would go considerably further. In bee-hunting I never tracked black bees over a mile and a half from their habitation. All the wild bees here in the woods are black bees. Some of these bees are wonderful workers too. Bee-trees have been cut here at an elevation of 6000 ft., and some of these have contained upward of 300 lbs. of honey. Large quantities of honey are sometimes taken from wild bees here in these mountains, being the accumulation of several years of gathering. I remember one bee-tree in particular. In the month of July, having some leisure time at my disposal I started out bee-hunting. Having arrived at the place, I found a number of bees working on penny-royal. I was soon trapping them, and noting their line of flight. In a few moments I had a pretty fair line started up the mountain-side. I had to crawl on my hands and knees quite a distance. The mountain-side was covered with a dense growth of young hazels, deerbrush, flowering dogwood, young firs, and spruces. After wandering about considerably I came across a large dead fir-tree, a regular old patriarch, having withstood the storms of several centuries. After making a careful scrutiny, I observed the bees, entering where an old limb had broken off, at a height of about 120 feet from the ground. The tree was about seven feet in diameter. A few days afterward we cut it down; and in felling it it struck a large rock and was mashed all to pieces, throwing bees, honey, and brood in all directions. What few bees were not killed were terribly cross. We had quite a time gathering up comb and honey. The ground around where the tree had burst was covered with it. There must have been nearly 300 pounds of honey, if we could have saved it. Part of it was candied. We did not try to save the bees, too many being killed.

S. L. WATKINS.

Placerville, Cal.

To be continued.

HOW VANKIRK OBTAINED 20 CTS. FOR HIS HONEY.

BUILDING UP A REPUTATION.

FRIEND ROOT:—As I have not time to answer private letters I will ask space to answer some of the questions that my report in GLEANINGS, Sept. 1, has brought. I have been selling honey in our town for about fifteen years, and I have a set of customers that always depend on me for their honey. My price for about a dozen years has been 20 cts. per lb. for choice comb honey, and I have no trouble in getting my entire crop off at this price. It is sometimes higher and lower in our market, but all that buy my honey know that the price is the same, year after year. Choice comb honey has been worth 25 cts. per lb. in our town this present season, and I could have had that price for mine. But if I should raise on my customers when it is scarce I should have to come down when it is plentiful. It is not scarce here, by any means; but the consumption is great—

er than it has ever been since I have been in the business. I sold from the wagon this season from thirteen to nineteen dollars' worth once a week for quite a number of weeks, and canvassed only a very small portion of the town. I run a trip once each week with other produce, and the honey goes along as a "side issue."

Can you sell your honey here at these prices?

This is the main question that I have to answer. I answer, no. There has been so much honey shipped here, of poor quality, that the people will hardly buy at any price. There has been "California honey" sold here that never saw that State, and "Ohio honey" that only passed through the State. Some of our leading bee-men have shipped honey here with their names on the crates that was fair without, and the worst-tasting honey within that I ever sampled. But this is the exception. Dear friends, your honey is just as good as mine, and I could sell thousands of pounds of it for you if it were "Washington Co." honey. I have tried purchasing honey to supply my trade when I was short, but it did not work well, and it wasn't the honey's fault. I once got a small case of very good honey from friend Root to supply a lady customer, but she declared it didn't taste like mine. It is prejudice and conceit, and not so much the fault of your honey. Now, friends, I would gladly help you; but "charity begins at home." I have all the work that I care to have, and once for all I can not handle your honey. Our grocers are nearly all nice men; and if you would try them they might help you out. My experience has been, that it were better to sell at home. If you are a pretty good man, and have pretty good honey, I don't think you will have any trouble in getting it all off before honey comes again. I feel sure that I could do it, and I see no reason why you can not if you will just wake up and arouse your "latent vim." I hardly know how I acquired my reputation; but one thing I do remember: It took patience and hard work.

L. W. VANKIRK.

Washington, Pa., Nov. 21, 1889.

Friend V., we read in the good book that "a good name is rather to be chosen than great riches," and your statement above verifies it.

BEEES UNDER THE BED.

A CHINESE HOUSE-APIARY.

FRIEND ROOT:—I have something a little odd to tell; but in order to tell it well, I must first tell a few other things. One very common way which the people in this particular corner of the world have of building their one-story or story-and-a-half houses, is as follows: A foundation of cobble stones having been laid where the side walls are to stand, and perhaps also where the back of the house is to be, two broad planks are fastened on their edges between upright poles set in the ground, on each side of the foundation, and damp earth is put between them and pounded down hard. The planks are then raised one course higher, fixed firmly in place, and more earth put in and tamped down, and so on till a height of ten feet or so is attained. Then a wood frame is put up inside of these walls. If the house is designed for a shop or store, the whole front consists of movable boards sliding in grooved pieces at top and bot-

tom. This is the general plan on which many a Chinese inn is built. To economize space, the tavern-keeper generally has a *box-bed* for his own use. This consists of two boxes, each one about 3 by 3½ feet in length and breadth and 2½ feet or more high. These two boxes, set side by side, make as good a bedstead as most Chinamen have. I was resting in front of a tavern one day last February, when I observed a string of bees pouring in and out through a crack between the corner post and the earth wall on my right. Through the obligingness of the landlady I was enabled to investigate the matter. There in that corner of the building stood one of these box beds. Rats had gnawed a hole in the lower corner of the box at the bottom, close by the crack, and through this crack and rat-hole the bees had come in and taken possession of the box. The landlady told me that they came of themselves in the previous May, and that she cut out their stores last fall. They had nearly half a bushel of new white comb partly filled with clear honey. Rape, which is much cultivated here as a winter-spring crop for making rape-seed oil, was just coming into bloom, and the bees were doubtless at work on this. In fact, ten days of mild weather had started a number of wild plants to blooming, and the bees were booming. Chinese bees always seem very docile. Rape honey is said not to be equal in flavor to tea honey. The tea-plant blooms in December.

Shaowu, China, March 20, 1889.

MANUM'S HOME APIARY.

HOW IT LOOKS IN WINTER.

MR. ROOT:—Agreeably to promise I herewith hand you a view of my home apiary in winter. This picture was taken the day following one of our Vermont snowstorms, and, as will be seen, Manum walked out into the snow nearly up to his waist to have his picture taken. There is quite a contrast, as you will observe, between his complexion and the beautiful snow, as appears around about the hives in the front row on the left. The playful winds toyed with the descending flakes in such a manner as to cause them to nestle down one over the other, between the rows, leaving the hives somewhat free from snow, while that portion of the apiary on the right is almost completely covered.

I am often asked if I shovel the snow away from the hives whenever I find them so covered with snow. My answer is, "Not always;" though when there comes a warm spell, so I think the bees can fly, I do so, that they may have a cleansing flight, which I believe to be very essential for the welfare of the bees, especially if their stores consist principally of honey, but not so essential if composed chiefly of sugar syrup.

The rows of hives at the left, along by the fence, have been some winters completely covered with hard drifted snow—so hard, in fact, that I have been able to walk over the hives, and a stranger would hardly have believed there were live bees under so much snow, and yet the bees always came through in good condition. But remember, whenever there were indications of a thaw I was on hand to give the bees their liberty. I well remember the first winter that the snow drifted in the manner above mentioned. I took a shovel and un-

dertook to dig them out; and after working a while I struck the corner of a hive about three feet below the surface of the snow. I continued to work away until I had dug a sort of well in the snow in front of the hive. As it was pretty hard work, and as I thought my time was worth more in my harness-shop than it would cost to hire it done, and *thinking it must be done* or the bees would smother, I secured a man to do the shoveling, and returned to the shop. In about an hour the man came in to ask what he should do with the snow shoveled out. I returned with him, to find that only two hives had come to light. I also found that, owing to the snow being packed so hard, the man had broken my shovel, and borrowed another of a neighbor. I finally scratched my head, and commenced to think and reason, and came to the conclusion that, as there was only about one foot of the top of this snow that was so hard, while the remainder was comparatively light, I decided that there would be air enough circulating through it to answer the requirements

being buried under snow too long at a time; but I do not object to their being well banked, except in front; yet I do not think that much snow around our double-wall (or chaff) hives is very much benefit after all. I once thought it was, and I have banked it around them; but I do not do so now, as I find that the bees in the hives wholly exposed—which are in the same apiary with those drifted under—winter as well as any; therefore I have come to the conclusion that deep snows are really no great benefit, nor, if watched, any great damage to the bees. If I could have just the proper amount of snow around the hives all winter I would not object, providing it be removed as soon as there comes a thaw; but to have the hives completely covered for a long time is, I think, detrimental to the bees, as it causes too early breeding, if the weather is mild.

After my bees are all packed and fixed for winter—which I usually do the last week in October or first of November—I leave them entirely undis-

A. E. MANUM'S HOME APIARY IN WINTER.

of the bees. I therefore discharged the man, and left the bees to their fate.

In about three weeks from this time we had a thaw, so that bees not so protected by snow had a good fly. I left these for experiment. In March the south winds so melted the snow that I was able to clear the entrance of all the hives, when the bees had a good fly, and I found, upon examination, that every colony was alive and in good condition. But, mind you, that, if my entrances had been at the side of the hives, as in most hives in use, and not underneath, as they are in my hives, I believe the result would not have been so satisfactory, as it is impossible for my entrances to become clogged by ice, as is often the case with side entrances. Since then I do not worry when my home apiary is buried in snow, because I am near by to shovel out when there comes a warm spell; but not so with my out-apiaries, as I have lost bees in out-apiaries by their

turbed until there comes warm weather enough for the bees to fly. Then I shovel away the snow from the entrance, and pull the slides to see that the entrances are all clear, and at once return them, as the notch in the slides gives the bees all the entrance they need in winter and early spring, it being 2 inches long by $\frac{3}{4}$ wide.

Since I have used the Bristol hive there have been two winters when the bees were unable to fly from November till April; hence not a track was made in the snow in any of my apiaries.

I will add, that my bees never wintered better than they did the two past winters; however, I always feel better when they can have at least one good cleansing flight in January.

Were I using hives with the entrance unprotected, as most chaff hives are made, I would either lean a short board against the hive over the entrance to protect the entrance from being clogged

by snow and ice, or I would take pains to keep the snow away.

Bristol, Vt.

A. E. MANUM.

Friend M., I was greatly pleased to get your excellent picture of an apiary in winter, because it may give perhaps hundreds of our readers, if not thousands, a glimpse of something they have never seen. I am very glad indeed to get the facts you give us in regard to bee-hives covered with snow. We notice in the picture there are ventilating-holes in the upper part of your hives. Now, I should think this would afford air enough. Of course, after a long confinement it may be desirable to cut away the snow, so as to give the bees a fly. My impression is, however, that with the greater part of our readers more harm than good will result in tinkering with the hives in winter. I am afraid it would turn out as it did with the man you hired. In our locality we never had snow enough to do any harm, in my opinion. We have such frequent thaws that there is almost always a space above the entrance, between the hives and the snow, to let in air, and to let the bees get out. I have often seen them crawl up the side of the hive, take a fly, and return in the same way.

THE ALFALFA FIELDS OF ARIZONA, ETC.

BY J. H. ROOT.

BRO. A. I.:—In reading the report from the Nevada man, Mr. Ball, I was somewhat surprised at some of his answers compared to alfalfa grown in this valley. I always supposed it required warm weather to raise good alfalfa, as here in the warm months it grows very fast with proper care. Some cut it five times, and some six and even seven times in one season; but it can be cut five times, and then be pastured from the last cutting until spring. It remains green here all winter. Some are cutting now. I see a great deal of it in bloom yet. The beauty of this valley for bees is, there is no dew at night, and the bees can go to work as soon as it is light, and can work nearly every day in the year. They say they can gather their living here during the whole year, summer and winter. The bloom from an alfalfa field is sweeter than any flower-garden I ever saw. I suppose that is owing to there being so much honey in the blossom.

The honey here is different from that of California or the East. It is sweeter, and has more of a sugar taste in it, and is whiter. I never cared much for honey East; but here I can eat it all the time.

In this valley the water is run in between borders about 100 feet apart, the distance depending upon the lay of the land. If level they are further apart than when rolling. They do not furrow here nearly as often as they do in Nevada.

The only one great objection to the bee-business here is transportation on the supplies in, and the honey out. There is no trouble in making honey, and there is a railroad on foot now that will open up the lumber district from the mountains and give us a market out for all our hay, grain, poultry, and dried fruits.

I get fine alfalfa hay for my cow at \$3.50 per ton, when in the lumber region, less than 200 miles from

here, it brings \$30 per ton, and every thing else in proportion. Times are awful dull here now, because the markets are hard to get to—that is, mining and lumber camps; but the new railroad runs to both. Now is the time to strike this valley, as lands are cheap. I like it here much better than Southern California, where lands were held at from \$150 to \$400 per acre. Good land can be got here by buying a "right," from \$450 to \$1000 per 160 acres, and then water can be had for so much per share, or part of a share, depending upon the canal. The way the land is situated, some canals sell ten-acre rights for \$100. That includes so much water. They calculate 100 inches here to water 160 acres. Well, the more the country is irrigated here, the more water there is from year to year. The water is coming nearer the surface. The main canals are taken out of Salt River, up near the mountains, and is then run all around the valley in small ditches. Without water here there would be no living thing, as the rains are very few. We have had only two since I have been here. They were good ones, though.

I have not had a stove in the store yet, and have been comfortable. We get good mesquite wood at \$2.50 per load.

I can not tell you as much about the bees as you would find out from some of the bee-men. Alfalfa for stock is the same as bread to us. Hogs and poultry will keep fat on it, and stock will eat every particle of it as clean as though it were oats.

Tempe, Arizona, Nov. 22, 1889.

JESSE.

Many thanks, dear brother, for the important facts in regard to the matter you furnish us; and we are now looking forward to the time when I can make my second trip to California, taking in Arizona. I say "we," for I mean there will be two of us—Mrs. Root and myself.

CHAS. F. MUTH.

AN AUTOBIOGRAPHY OF ONE OF THE PIONEERS IN THE BEE-BUSINESS.

FRIEND ROOT:—Since you insist on a biographical sketch of my humble self, I shall endeavor to give you a history of my existence in America in as few words as possible.

I was born and raised in Hesse-Cassel, Germany. I arrived in Cincinnati in the spring of 1854, about 20 years old. Here I found a situation as salesman in one of the best groceries of the city, a business to which I had been reared. A desire to see the country, made me give up a very good situation after a stay of two years. I saw the orange-groves, sugar and cotton plantations of the South; and after my ambition was satisfied with a few years' experience in the wild West, I returned to Cincinnati; got married; filled a position as salesman in another grocery for nearly three years, till I started my own business, in 1861, at 976 and 978 Central Avenue, in our city. Two years afterward I bought the property, built it up, and am living there now.

My career as bee-keeper commenced with the establishment of my business, in 1861, although bees have been my hobby ever since I remember.

The first five colonies of bees in patent (?) box hives were placed on my roof in 1861. These patent

hives did not fill the bill with me, for I had read father Langstroth on the Hive and Honey-bee. I commenced to read the *American Bee Journal*. I read every book in the English and German languages within my reach, and was an interested reader of every periodical on the bee-question, as they, one after another, made their appearance. The *Bienen-Zeitung*, Salzburg, Germany, with its able editor, Schmidt, was a great source of information, as well as the *American Bee Journal* under Wagner. I have read, and still have, each issue, beginning with the very first of each. It is due to my friend Hill, Mt. Healthy O., that I adopted the Langstroth hive. Hill was my first tutor in scientific apiculture.

CHAS. F. MUTH.

You may remember yet, Brother Root, that I was one of the first warm advocates of "extracted honey." My labels read to-day as they did in 1869—"Pure machine-extracted honey." You remember, perhaps, also, the objections of old to the words "machine extracted." We have had for years, perhaps, as large a home trade for extracted honey as any house in the country. My first tin honey-extractor was made in 1869 by H. W. Stephenson, of our city, after the pattern of a wooden extractor made for me the previous season by Propheator Bros., coopers, of our city. During the season of 1870 I sold my first four tin honey-extractors to bee-keepers in this neighborhood.

My apiary has been, since 1861, on the roof of my house, and the average number of colonies per season is about 45. The largest average yield per colony in a season was 198 lbs. of extracted honey, all of which was gathered during 26 days, in the month of June. My largest crop in a season was

between 6000 and 7000 lbs. So you see I was one of the first to make good use of the honey-extractor.

This neighborhood has been visited by foul brood for the last eight or ten years, and our ardor as bee-keepers considerably dampened thereby. The study of the cure of foul brood has been an expensive experience to me. I have cured hundreds of colonies, but I can not prevent reinfection, and I have come to the conclusion that the cheapest and best remedy, after all, is the brimstone-pit, and wiping out of existence the stand, hive, combs, and all, on first discovery.

CHAS. F. MUTH.

Cincinnati, O., Oct. 22, 1889.

FLORIDA.

APPURTENANCES AND METHODS NOT NECESSARILY SUITED TO THE SOUTH.

MR. ROOT:--GLEANINGS reaches us regularly, is looked over closely, and then carefully read and thought over. I have been a reader of its teachings for about 14 years.

I have always found something in each number, which, practically applied, has proved to be worth the yearly subscription price of one dollar, or, for the 12 years' reading, \$288. This may appear to many a high estimate of its value, but I am sure I should much regret to be set back in the A B C of 14 years ago for the sum of \$288, and I think I speak the thoughts of many others of its patrons and readers.

There are a great many of the thoughts, theories, and appliances, used, recommended, and put before the bee-keepers, that are entirely useless to us in this climate. The problem of wintering is a great study. The care and cost, and the loss, are often great, even after all the precautions taken to make it a success; also spring dwindling, and a sufficient amount of stores to feed them until they can secure their living—all this is superfluous reading to us here.

LARGE VERSUS SMALL HIVES.

There is much speculation about large hives vs. small hives. Much of this appears very useless argument. The farmers of the country could, with equal claims over the officers of agriculture, advocate large horses in Ohio when small ones in the cotton-fields of the South would be far more economical, and so with hives. Location, source of honey, season, climate, all these may and do certainly and practically, and with a view to economy of the bee-labor, and that of the man, make a difference in the working size of a hive, as necessary as the different places where they are in use; hence the arguments appear useless, and the talk about a "standard" hive would be like a standard plow suitable for all climes and soils. But when real, practical, scientific, and natural subjects are made a basis of argument, then the interest is aroused all through the fraternity, and good will be the result. This, then, brings out thought, and reason from cause to effect. Such reading is very desirable; gives useful instruction, when personal arguments about "the hive I use" are of very little value to the practical honey-producer who thoroughly knows the flora of his location, and adapts the hive he uses to the profitable production of honey. The best argument is the honey produced. The hive is a very small part of the necessary elements of suc-

cess. The man or woman, and the flora, are the main stay of a successful honey crop.

Our crop of honey this year has not been large, but we are well pleased that it was as good as it is. The quality is of the very best. We commenced the season with 20 colonies, only in fair condition; made no increase, and have taken 2000 lbs., all extracted, quality excellent. It was sold by the gallon at \$1.25, all at home, except 20 gallons to A. I. Root, and 40 to Dr. L. H. Harris, Pittsburg, Pa.

Our bees are located at St. Francis, on the St. John's River, 10 miles from Deland. The honey gathered there can not be excelled in the State, and I very much doubt whether it could be in any other State.

I see that Mr. C. E. Jones says he is going to move 200 colonies to Florida for the orange-blossom honey. I hope he will come. The orange honey is very fine, and the bees are a great help to the setting-on of the fruit, carrying the pollen into the bloom as soon as it opens, thereby causing a more complete fertilization than would be without their aid, when the bloom first opens, when all its nature is complete. I can not well dismiss this subject of the honey-bee being a great help to the orange-groves. They carry the pollen into thousands of flowers that are pendent, that would perhaps never be reached by any other source, or, if so, only by the floating particles. More than this, my attention has been called to some of the groves in this vicinity; and where there were bees kept, this season the orange crop is very fair, fruit evenly distributed, while other groves, not having any bees near them, are not so full of fruit, and not so evenly distributed; and I think the day is not far distant when the large grove-owners will solicit bee-keepers to bring their bees within reach of their groves, thereby benefiting both parties.

I see, friend Root, you have been up among the northern bee-keepers. Could you not make a visit to Florida this winter, and call and see us? I think you would enjoy it, and also in the trip call on friend Poppleton over in Cuba. Do come—our latch-string hangs outside the door.

JOHN CRAYCRAFT.

Altosna, Fla., Aug. 24, 1899.

A REFERENCE TO QUESTION 111.

GENTLE BEES, BETTER WORKERS, AND SMALLER CONSUMERS.

WHICH will make the better working colonies during the working season—that is, secure the most honey—those that require 20 to 25 pounds to carry them through, or those that will get along on from 5 to 10 pounds while in winter quarters?

The various answers to this question, and your remarks, set me to looking back for several years, and thinking up concerning various strains that I have had for the past 13 years. That there is so much difference in different strains concerning the amount of stores consumed between November 1 and April 1, I can trace back to 1876, on a queen that came from C. C. Vaughn, whose stock was always strong, as were also those of her daughters and granddaughters. From the time of the end of the fall harvest to the time of pollen and honey in the spring, it was a rare case to see the workers fly out much; and for 7 or 8 years that I kept this

strain as near pure as possible, it was very noticeable what a small amount of stores was consumed, and it was also noticeable to the same extent where this blood was intermingled with some other strains.

Between 1876 and 1882 I obtained new queens from 15 different strains; and among them were several that were noticeable for their extreme activity, as were those referred to from C. C. Vaughn, and two other places, for their extreme quietness. Those that were so active consumed *pro rata* as much more stores as the quiet ones did in minima. These quiet strains always came out strong in the spring, were always in readiness for the harvest, were gentle to handle, were good to go to work in the boxes, and did a good business at boxing; and just the reverse were the results from those that were active, and consumed a large amount of stores from November 1 till April 1. These various differences were noticed by other parties in this locality for 12 or 15 miles in all directions, and by those wintering in the cellar, in clamps, or on the summer stands; and as those that were quiet built up strong and fast in the spring, just as noticeable was the spring dwindling of those that had been active; and the active ones were, in the same proportion, irritable, and prone to sting. These qualities were so apparent, that several of the bee-keepers I know of made it a point to keep weeding out the active propensities as fast as possible. The active ones were more inclined to swarm, and were quite often very much given to not freely taking a new queen, and to very often ball their queens whenever the stocks were examined. The workers of these active stocks were generally among the brightest-colored of the apiary, and the quietest were among the dull and darker colored ones, and were quite often called, by those that were not experienced, the "hybrids."

These quiet ones, when started to breeding in the spring, usually consumed stores enough to make up for their lack when in winter quarters, and not uncommonly surpassed the amount used by the active strains; so you see that the experiences of the past 13 years here in Connecticut are in accord with Mr. Doolittle's, and why should they not be? because bees at several of the apiaries contained blood of his strain, and from the Dadants' too, and from stock from imported queens from A. I. Root, and from queens from the Oatmans, Alley, and Nellis. That there is a vast difference in regard to the uneasiness, activity, and amount of stores consumed, seems to be qualities possessed by various strains or families of bees; and that these propensities are perpetuable characteristics, are things that I am not the only one who is convinced that we must guard against. There are apiarists within a few miles of me who think as much of keeping a record and pedigree of their bees as any Jersey, Durham, Devon, or Holstein breeder does of his cows; and by these memoranda for from 10 to 20 years they have arrived at the conclusion that blood will tell in the bees as much as anywhere else in the animate kingdom; and yet one will preach out, "It's pollen;" another will preach, "It's poor honey;" another, that it's the weather. Why, Mr. Root, I know where there is a bee-keeper—yes, several of them—who will tell you, and prove it by practice, that it is an absolute necessity for the bees to have lots of pollen that they may winter well, and they have followed the practice ever since 1877, and they

don't lose their bees either. I practiced it in one apiary myself ever since 1877, and it is the apiary where I always have the strongest colonies, the first drones, and raise the earliest queens, and lose the fewest colonies in winter or spring, and yet they have all the pollen that I can give them. I think that question 111 will set many to looking for some of their winter losses among these very active and naturally uneasy colonies, and find not a few of their most unprofitable ones among the same class. I have found it so, and so have some other beekeepers. Just look around you; keep watch, and see if I have not told you a grain of truth this time.

One thing more: While I was looking over the bees in the Grove Street Apiary in New Milford last week, one of those pleasant days (the thermometer told 60 in the shade), it was very plain to be seen that those stocks having used the least amount of stores were in the best condition, were the strongest, had the fewest dead bees on the bottom-board, and, besides that, could be traced by the register for the past four seasons to stock possessing those qualities, and just the same could those of the active and weak stocks be traced out in their qualities.

H. L. JEFFREY.

New Milford, Ct., Mar. 18, 1889.

AN A B C SCHOLAR'S EXPERIENCE.

HIS UPS AND DOWNS.

EDITOR GLEANINGS:—Do your students of the grammar class, bee-college graduates, "and all that," ever look back to the time when you did not know a drone from an eye-bunger bumble-bee, or a worker from a yellow-jacket? I am pretty sure you do, judging from the kindly sympathy and infinite patience with which you answer our questions and rehearse the (to you) monotonous beginnings of bee-lore. I suppose I am beginning much as some of you did—knowing almost nothing on the subject. I am not much given to enthusiasms, so when this fever struck me the attack was something serious. There was no incipient stage, such as is common to fevers, and my system seemed unable to resist the contagion in the least. I caught the disease from a stray copy of a book which I found in the Y. M. C. A. library of our town; viz., "Blessed Bees," by John Allen. Being favorably disposed toward Hahnemann's "*Stimilia similibus curantur*," the medicine I took was Quinby's Mysteries of Bee-keeping, Root's A B C, and a subscription for GLEANINGS, full doses of each, daily. As pulse and temperature seemed to increase under this treatment I prescribed for myself a remedy which is said to often effect a cure when all else fails; viz., a swarm of bees. I had a deal of faith in this last medicine. I thought, if it both does and does not cure rheumatism, there is at least a good chance that a few stings will cure the bee-fever.

But like failed to cure like in my case; on the contrary, the prescription worked up an enthusiasm which as yet shows no signs of abatement. There was unalloyed pleasure in the hours that I watched them, investigated, experimented, blundered, and rejoiced to see how docile and patient they were with me; how quietly they repaired my mistakes, and recovered from the effects of my mismanagement.

My first task was to transfer them from the bar-

rel in which they were brought to me, to an L. hive. I had every thing at hand that I expected to use. Even my better half, in gloves and mosquito-net veil, was there as assistant. It was seven o'clock of a bright August morning when I inverted the barrel and began operations. I may as well confess I was "scared of them," as our colored girl put it. It was no with little trepidation that I sawed the hoops away and put a carving-knife into the combs and my bare fingers among the bees. But they respected my sentiments, and I got but two stings that day. What a mess I made of it! By the time I was half done, the barrel fell to pieces, and there were about two robbers to every home bee. I could not keep them off a comb long enough to lay it down on the table, and was obliged to fit and tie, with every thing black with bees. In an hour and a half I had six frames of pretty fair comb hung in the new hive, and the most of the bees were in too, or flying about the entrance. I did not see any thing of the queen, and don't know when or how she got in. Then I left them to their own devices, and did not see them till next morning, when I opened the hive, and, to my great surprise, found they had not a drop of honey. I had hung the frames in half full of honey, but the robbers had kept on at their work after I had finished mine, and had cleaned them out.

As there is very little honey in our summer flowers, I knew I must feed them or they would starve, or, at least, raise but little brood. So I fixed up a pepper-box feeder, and for two or three weeks gave them a nightly feed of sugar syrup. A few days after transferring, while removing some clasps and sticks, I found the queen. Didn't we all rejoice, though, over that first sight of a queen-bee? Wife and children gathered about me as I held the frame and watched her run over the comb, and tried in vain to see the "attendant bees," the "retinue," pictured in our books. Such a beauty she was—long-bodied and yellow! We, at least, did her homage, if the bees did not. By smoking the bees off the center of some of the combs we found she had been laying. Then we counted the days until the brood was sealed, and again until the inmates of the cells cut their way out, fuzzy-headed and hungry. It was a revelation to grown folks and children; and we took daily observations of their progress, and read and talked of them, almost to the exclusion of other topics.

If our incessant smoking and watching hindered them in their work they did not show it; and soon there were so many bees and so much brood that I concluded to divide them, and see if they would raise some new queens. I had given them two or three frames of wired foundation which they had drawn out, and nearly filled with brood; so I thought I had enough for two pretty fair nuclei. I took the queen and all but three frames of brood to hive No. 2, when they went to work, very few leaving for the old stand. Then we watched No. 1 closer than ever. In two days they had four cells started; and we saw with an interest that amounted to excitement, the baby-queen lying in its milk-white bed, which we knew was the royal jelly we had read about. One was so big when only three days old that we were afraid it would not make a good queen; so I tore it out. In due time the rest were capped, and we waited, impatiently enough, for the culmination of our hopes. One morning there was an empty cell, and a nice young queen travel-

ing on a tour of inspection over her kingdom. The other cells were yet intact, and I cut them out to save her majesty a quarrel.

All had been plain sailing so far, and we were proud of our success—perhaps a little too much elated. Perhaps we needed (at least we got) a lesson which we will not soon forget. The queen-raising was done in October, while the bees were getting a good deal of honey from goldenrod. About a week after our queen was hatched, the harvest ended. I was feeding my two swarms a little daily, as I wanted to have them strong when orange-blossoms came, in February.

One evening I came home and found things in a turmoil. Bees were flying about wildly, crawling over the hives, and fighting everywhere. As it was then after sunset I did nothing and soon had the pleasure of seeing the robbers withdraw their forces for the day, and things quiet down. That was the beginning of the end. I shut up my hives for days at a time; but, shut or open, the thieves were there at daylight, and stayed until dark. If I left a hive open so just one bee could get in or out, the result was an all-day fight and a pint of dead bees at evening. After a week of this sort of thing I opened No. 2 one morning, and found the bees so starved that they could scarcely crawl. They were tearing out the sealed brood. I gave them a good feed, and shut them up "for three years or during the war."

In No. 1 my beautiful young queen was dead, and there was no honey and no brood. There was a sorrowful party around the evening lamp that night. Two-thirds of our bees were dead, one hive queenless, and a poor outlook for orange-blossom honey. The conclave decided to unite what were left, shut them up, and feed by lantern light until spring if necessary.

I was afraid they would fight, and kill the queen; but it seemed the only thing to do. So I hung the frames on opposite sides of a hive, inverted a Mason quart jar of syrup in a saucer, between them, and left them to their fate. Next morning the jar was empty, and the queen all right. That night I put the frames together, and the feed in a wooden butter-dish on top of them. Twenty-four hours later the queen had changed sides and all was quiet. In a few days the thermometer dropped to fifty, and the robbers suspended operations. We have also suspended our experiments and investigations, and are going to feed steadily, and give the veteran survivors of the autumn campaign the rest which they so richly deserve.

As to the outcome of this, my first term in the school of bee culture, I think it has paid largely in experience, and over and over again in enjoyment. The A B C has been our text-book, and we look on it as the X Y Z as well, in all that pertains to the honey-bee. GLEANINGS is devoured as soon as received, and re-read to wife and children when the evening shadows bring us together. We are glad to have found our way into the circle of genial, intelligent patrons of this pure and elevating industry, and glad to find that so many of you are confidently looking forward to even a better inheritance than our all-bountiful Father has given us in this beautiful world.

E. J. BAIRD.

Orlando, Fla., Nov. 20, 1889.

Friend B., the story of your commencement is so nearly like my own in the earlier volumes of the *American Bee-Journal*, be-

fore GLEANINGS had an existence, that it would make you smile to read it over. I had exactly the same troubles with robbing, and I once thought I would almost go to the expense of a trip to either Langstroth or Quinby, to have him explain to me just how I could tell robbers from other bees, and know what to do when they acted as they did with you. I was assured by bee-men of experience (through print, of course, for I had never seen a live bee-man till I commenced), that in a little time it would be all plain and easy.—Your plan of shutting your bees up for "three years or during the war" may do when you can not do any better; but I should regard it as a wasteful way, at least when honey or pollen is to be obtained. Almost any colony will defend itself from robbers if it has plenty of bees, a fertile queen, and an entrance not too large for the quantity of bees. I rather think they defend themselves a little better where they have brood in all stages. When they are suddenly attacked they sometimes have to have a little assistance until things are straightened up, and a decision has been made as to who is running the institution—the robbers or the honest owners. You will get out all right—never fear. We shall be quite glad to hear from you again. Give our respects to Mrs. B. and the little "B.'s," who are interested in the success of the new enterprise.

BEES IN HOUSE-APIARIES.

J. A. GOLDEN'S METHOD.

FRIEND ROOT:—I inclose you a picture of my plan of keeping bees, also how I hive them. If you look at the further house, and at the lower right-hand bee-entrance, you will observe what we call a feed-board. On each side there is a wire hook that fastens into two small staples placed in the alighting-board at the proper

GOLDEN'S HOUSE-APIARIES, AND PLAN OF HIVING SWARMS.

places, the standard being hinged to the under side of the feed-board, with a nail driven into the lower end, filed sharp, and, when swung against the house, will hold the board very rigid. It is one of the handiest tools one can have about a house-apary for living bees. I use the wire basket that shuts automatically when the bees drop into the basket, should the bees cluster on a tree; but I usually catch the queen when she comes out, and place her in a trap, and hang the trap on a pole or in a tree, as you will observe in the picture. The bees will soon cluster, and may be shook on the feed-board, the queen liberated, and hived with the least trouble. The small dark spots above the entrances are two-inch auger-holes with funnel-shaped wire-cloth bee-escapes. A three-inch space between the hives and weather-board is packed solid with sawdust, answering the same purpose as the chaff hive. During the winter I fill the porticos with straw, having an air-chamber on the inside of the house to the hive, covered with wire cloth, that affords abundance of air for the bees. I also have a three-inch tiling, 60 feet in length, passing about six feet under the ground, and conducted thence up through the floor of the house, having a small ventilator at the roof; and on a cold day one would be surprised to see how mild the air seems to be, passing from the ground. My floors are carpeted, and no jarring is noticeable when one desires to examine the bees.

J. A. GOLDEN.

Reinersville, O.

ALSIKE TURNING TO WHITE DUTCH CLOVER.

ALSO RED CLOVER TURNING TO ALSIKE; AN EXPLANATION OF THESE APPARENT PHENOMENA.

MR. C. L. GOUGH states in GLEANINGS of June 1, that he believes alsike has turned to white Dutch clover with him. Now, after an acquaintance with both of these varieties for years, I think he must be mistaken. That the changes, as he states them, undoubtedly do happen in hundreds of fields all over the United States, I believe. Perhaps it would be better to say that one kind of seed is sown, and, by some reason, destroyed, and another growing plant, perhaps of similar habit, takes its place. Some of the reasons that may lead us to think alsike may change to white Dutch, are, that in many seasons, on a dry soil (especially if sown thick), alsike will grow short, and about the height of white Dutch, and it will also have a great many nearly white blossoms. With us, about the middle of June, there were many stalks of white Dutch one foot in height; but the difference between this and alsike could be readily seen by comparing their different way of flowering. The flower of the white Dutch is borne at the top of a leafless, branchless stem, springing from near the root of the plant. With alsike there is generally a flower formed for every joint on the stalk of the plant. This difference in the manner of flowering is sufficient to show that one variety can not change to the other in the course of a season.

To account for the presence of the white Dutch in any soil here is not difficult, as it will spring up under favorable conditions everywhere. The seeds are probably scattered by the winds, animals, etc. On a piece of ground lately cleared of timber, the

white clover has made a fine growth, and yet probably no grass seed has ever been sown there by the hand of man. May we not refer this to the provision made by an all-wise Providence to always keep the ground covered with growing plants?

One of my neighbors has perhaps some reason for thinking that red clover turns to alsike, although he knows better. He seeded a field of six acres to red clover and timothy, and was surprised the next year with a fine growth of alsike. It had been about ten years since any alsike had been sown on this field; but the conditions were favorable for its growth, and all the seeds in the soil germinated, while the red clover had been winter-killed. Perhaps the same happened to Mr. G.'s alsike, and the white Dutch came in its place.

Watkins, N. Y.

CHAS. CHAPMAN.

Friend C., there is certainly something wonderful about the way alsike and other clovers come up, years after the ground was first seeded, and I think that this fact alone explains not only one kind of clover turning to another, but the complaint that has been made that seed furnished does not always produce the kind of clover that it ought to.

SPECIAL DEPARTMENT FOR A. I. ROOT, AND HIS FRIENDS WHO LOVE TO RAISE CROPS.

That art on which a thousand millions of men are dependent for their sustenance, and two hundred millions of men expend their daily toil, must be the most important of all. The parent and precursor of all other arts. In every country, then, and at every period, the investigation of the principles on which the rational practice of this art is founded ought to have commanded the principal attention of the greatest minds.

JAMES F. W. JOHNSTON.

EXTRA-EARLY CABBAGES.

Mr. Root:—Have you grown any or all of the following varieties of early cabbage? Early Jersey Wakefield, Early Etampes, and Early Express (both Early Etampes and Early Express have been renamed by several seedsmen, and called their "Earliest"). We should like to hear what you think of any or all the varieties named, under whatever name you may have grown them. We want to know what estimate of value you put upon them as early market varieties; which is the earliest, and which sells the best in market.

W. J. GREEN, Horticulturist,

Ohio Agricult'l Experiment Station.

Columbus, O., Nov. 26, 1889.

We have tested all the kinds you name, besides every thing else that has come out claiming to be earlier than the Jersey Wakefield. Some of them have, perhaps, been a trifle earlier, providing we call loose heads cabbage; but so far as sound heads are concerned, we have not found any thing that would compare at all with the best strains of the Jersey Wakefield. I ventured, two years ago, to plant just one row of Early Express, but the experiment cost me several dollars. The Wakefield was so near the same time in maturing, that no one would buy the Express at all, on account of its inferior quality. Landreth's Extra Early gave us a few fair heads; but there was nothing uniform about it. The product seemed to be all sorts and sizes, both early and late.

WANTED—A COAL-OIL STOVE FOR HEATING GREENHOUSES.

Mr. Root:—I want a small coal-oil stove for heating a small greenhouse; and as you have had experience in that line of business, and know the make that would suit best, I come to you. My house is quite small, and I want a stove to burn coal-oil in, and one that will not injure the flowers.

Kelleyville, Tex., Oct. 17, 1889.

J. BOWN.

Friend B., I can not find by any of the floral or gardening magazines that any such thing is in the market. I have seen accounts, however, of several home-made ones. It has been found necessary, I believe, to have some sort of a chimney, or small stovepipe, to carry off the gases and smell. As steam-engines are now run by coal-oil or gasoline, without question they could many times be profitably employed for warming greenhouses. Such a stove ought to be run 24 to 48 hours without any special attention. There are coal-oil stoves made for heating dwellings, to be found at most stove-dealers' establishments; but they will probably need some modification to fit them for a greenhouse, unless, indeed, your greenhouse is so small that no pipes for either steam or hot water are needed. An ordinary coal-oil stove answers nicely to keep the temperature of a cellar just above the freezing-point; and I do not see why they would not answer a similar purpose to keep flowers from damage, especially in the comparatively mild climate of Texas.

THE "PLANET" TOOLS, FOR LADIES.

Dear Sir:—Please be kind enough to tell me if the "Planet Jr." double-wheel hoe and cultivator (Figs. 10, 11, 12, 13, 14, and 15), illustrated in the catalogue you sent me, can be used by a lady; or if it is too heavy. Our soil is sandy and mellow; and as help is scarce, I should like to find something to help me work faster. MISS S. E. RAUCHENSTEIN.

Whistler, Ala., Nov. 18, 1889.

My good friend, unless you are very stout and strong, I fear that you will find any of the machines mentioned very fatiguing. The amount of enthusiasm you have, will, however, make a vast difference. You can take off some of the teeth or cutters, so as to make it run easier, but then it would not work so fast. If you possess the strength of an average woman, I think you will do much more work, and do it better, with the machines mentioned. I believe, however, I would first try the Firefly, Nos. 24 and 25. You can work these without any trouble, and they are easier than a common hoe, because the wheel enables you to go at exactly a certain depth, and not deeper. Of course, you must have nice mellow soil, or none of these tools will be available. If you could borrow one of some friend near you, before investing, it would be quite an advantage. A good deal depends on getting accustomed to these tools, and knowing just how to use them. Our average hired help do not get along very well with them. The trouble is, they do not understand it, and, worse still, they have no enthusiasm in making it bring out its best capabilities. Now, to me there is nothing I enjoy in the world more than taking these tools into the garden, after a

rain, when the soil is just dry enough, and make them put the plants in nice order, and do it rapidly.

HOW TO TELL WHEN A WATERMELON IS RIPE.

In my young days I was laughed at so much for pulling green melons (for I could not decide when ripe by thumping) that I put my wits to work to decide in some other way; and after experimenting for years I at last learned to tell very easily. My plan is this: I draw my thumb-nail over the melon, scraping off the thin green outer skin. If the edges of the skin on each side of the scar are left ragged or granulated, and the rind under the scar is smooth, firm, and white, and has something of a glossy appearance, the melon is ripe. But if the edges of the scar are smooth and even, and the thumb-nail has dug into the rind in places, and the skin does not come off clean, then the melon is green. I hope I have been explicit enough to make it plain. You can easily learn by experimenting on two melons, one ripe and the other green (after they have been cut open), and noting the difference.

J. J. HARDY.

Lavonia, Ga., Oct. 31, 1889.

Friend H., I have been in the habit of deciding somewhat as you decide—by appearance; but I never thought of scraping the melon with the thumb-nail. Since you mention it, however, I am inclined to think that your test is a good one, and we hereby tender you our thanks.

THE IGNOTUM TOMATO AND THE BEES.

The packet of Ignotum tomato seed sent me last spring by you gave me 25 plants, which yielded a good crop of tomatoes. I set them alongside of Livingston's Prolific. The Ignotum, with me, grew smooth and nice, of good size, with only one fault; and that is, in the blow end of the tomato there seems to be a small scar left, or rusty spot. They seemed to be wonderful bearers.

As to the honey crop, that seems to be almost a failure with me this year. I have 196 colonies of bees, and only 1300 lbs. of honey, all told, extracted and comb honey combined. I would lay the cause here with me to the excessive rains through the season for honey-gathering.

Akin, N. Y.

J. LINGENFELTER.

THE DELICIOUS VERSUS THE STRATAGEM PEAS.

We have had the Stratagem pea for several years. They are an excellent pea, but we have found something decidedly better. It is called the Delicious. It has larger vines, larger pods, and larger peas, and they are decidedly more delicious. They are a little later than the Stratagem; but if you try them once I think you will drop the Stratagem and take these for your main crop. The first year they did not seem to be quite so prolific as the Stratagems, but this year I think they were fully their equal.

E. Z. GREEN.

Montague, Mich., Nov. 22, 1889.

HENDERSON'S BUSH LIMA BEAN.

With me, the Henderson lima bean is No. 1—no sign of any tendency to run, and is two weeks earlier than the pole small lima beans planted at the same time, and it has the appearance of yielding better than the pole lima.

GEO. DREW.

Bunker Hill, July 20, 1889.

We agree with you, friend D., except in your last statement. The bean is certainly

very prolific, but we somewhat doubt whether it will give us as many bushels to the acre as the pole lima beans.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

THE STANLEY EXTRACTOR DEFENDED.

I do not consider Mr. Coe qualified to pass a correct verdict on the Stanley extractor (see page 957), as the one he refers to was made by Mr. Stanley, who never gave proper care to their manufacture. Mr. Coe got from him a machine whose baskets did not fit his frames; and in ordering new baskets, *months* later, from me, he put them (probably) on the same arms as the first ones, and did not get the nicety of adjustment that is necessary, or else has a very weak operator. A nicely adjusted, well-made machine, is *easily run, easily reversed*, and is appreciated by those who have tons of honey to extract. I inclose a card from Mr. A—, who used three machines the past season, one in each apiary.

E. R. NEWCOMB.

Pleasant Valley, N. Y., Dec. 3, 1889.

The inclosed is the card referred to. We withhold the name, as requested by the writer.

E. R. Newcomb:—The extractors I bought of you are all I could ask for in a honey-extractor. I have extracted tons of honey the past season, and they have worked *well*; but for certain reasons I would rather not have my name go before the public.

We are glad to get this; and may we not hear from others who have used the Stanley? Let the truth be what it may. We shall be just as pleased to get testimony favoring the Stanley as our own extractor.

THE HONEY THAT WILL NOT CANDY.

Have you any extracted on hand that is not yet candied? The heating of it is a small matter; but if it is not yet candied, it is an indication that it will not granulate so readily as what we have had. We have never before had so much trouble with honey becoming candied, and simply because we have been using the linden honey almost entirely. I have had several lots of California extracted from New York, but none that has been real nice.

Allegheny, Pa., Nov. 15, 1889.

M. H. TWEED.

Friend T., you call attention to something we had not particularly thought about before, only I had observed that honey once candied is, as a rule, much more liable to candy again—that is, if it is not sealed from the air, like canned fruit. There have been quite a few complaints this present season, that honey candies unusually quick.

WINTERING BEES IN A FRUIT-CELLAR.

Can you tell me whether bees will winter as well in a cellar with apples and potatoes, as in one with bees only, other things being equal?

Roseburg, Mich., Nov. 20, 1889.

J. MITCHELL.

Friend M., my impression is that a cellar that is right for apples would be rather cold for bees; but some may perhaps prefer to have their bees as near the freezing-point as apples will bear. I think, however, that

most bee-keepers decide that a temperature just right to keep potatoes to the best advantage would be about right for bees. Those who advocate keeping the bees at from 45 to 50 would want the cellar rather warmer than is best for either apples or potatoes. Potatoes would be more likely to sprout, and the apples more likely to rot. Apples do very well when kept just at the freezing-point, and a little below does not seem to harm them. I do not think that the odor from apples or potatoes would do any harm, unless they were rotting. Of course, in that case we should not want them too near the bees. Potatoes and apples also need a certain degree of dampness. This was formerly thought to be detrimental; but I believe late decisions have left the matter somewhat undecided.

TOILERS OF THE SKY.

How gladsome are the songs that greet
Our ear from forest, field, and street!
The songs of toilers as they fly,
The myriad toilers of the sky.

We do not know the words of song
The singers sing that haste along;
But yet we know they're songs of praise,
And Jesus knows what each one says.

Lord, how minute thy love and care
For thy creation everywhere!
The smallest gnat the eye can see
Is toiling on and praising thee.

And shall the sons of Adam's race
Be dumb before that blessed face
Who, from the stable to the cross,
Hath lived and loved and died for us?
St. Mary's, Ontario, Can. F. M. MASTER.

WINTERING ON HONEY-DEW; WHEN WE CAN AND WHEN WE CAN NOT.

The discussion of Question 148 in the Nov. 15th GLEANINGS was very interesting to me, as I have had considerable experience with honey-dew. In looking over my diary I find that my bees have gathered no honey-dew since August, 1884, until the present season. During the season of 1884 they gathered about 20 pounds of honey-dew to the hive. I also remember taking all the honey-dew from every hive except one, and this one colony was the only one that died. Nine-tenths of the bee-keepers' bees around here died that same winter. I find also in my diary that the winter of 1884 was a very severe one. The bees were confined to their hives 75 days without a chance to fly. They were in from the 9th of January until the 26th of March. Twenty days during this time the thermometer was below zero. Bro. Root, I suppose if you had been here you would have given a few colonies honey-dew the following winter, to see if it was that which really killed the bees. It would not have killed them the following winter, I know, because 35 days was the longest time that they were confined to their hives, being from the 4th of January to the 9th of February, with only six days below zero. This would make all the difference in the world. My bees have not been confined to their hives 75 days in succession in any one winter since. Last winter 59 was the longest, or from the 5th of January until the 6th of March, with only two days be-

low zero. It seems of late years that the longest cold spells come in the latter part of winter. Now, it was not always this way. If we have a winter like 1882 the honey-dew will make the bees kind o' tired. During that winter the worst cold spell came in the fore part of winter, or from the 12th of November to the 27th of January, making 75 days of confinement. During the winter of 1880 the bees were kept in their hives 99 days in succession, or from the 4th of December to the 15th of March. Any honey-dew during that winter would have been fatal. Now, if the fore part of this winter consists of a prolonged cold spell, Bro. Doolittle's eyes will begin to stick out toward spring. If the longest cold spell keeps off until after the first of the year, any hive with less than ten pounds of honey-dew is safe. If they have more I should not like to insure them. I left very little honey-dew with mine this winter; but having only a limited amount of white honey on hand I have placed them on short rations for winter. I winter half in a cave, the rest on their summer stands.

I have sold 40 gallons of honey-dew up to date, at one dollar per gallon. It is as black as pine tar, and has a very unpleasant flavor. Some of my hives stored as much as 60 lbs. of it. They gathered all of it from the 20th of August to the 12th of September, just working in the mornings. I extracted about half of it, and left the rest in combs. I don't think my bees will starve the coming season, unless they starve this winter. J. DALLAS.

Sharpsville, Pa., Nov. 26, 1889.

Friend D., you speak only of wintering outdoors, if I am correct. How about keeping bees 100 days in confinement in the cellar, as many of our friends do right along? I am inclined to think that some specimens of honey-dew are very wholesome; but I am well aware that the greater part of it is very poor. Sometimes when I get a taste of it in comb honey, I find it so exceedingly disagreeable that I do not wonder that it kills bees. Who was it, pray, that bought forty gallons of honey-dew, as black as pine tar, and what did they want to do with it—that is, if you have no objection to letting us know? If it was used for flavoring tobacco, may be it was all right, although I should be much better pleased to hear that the tobacco, honey dew, and all had been thrown away or burned up.

THE "BEE ELDORADO OF THE WORLD."

I see by the last number of GLEANINGS that Mr. W. K. Ball, of Reno, Nevada, gave you a few items about alfalfa. I have no doubt but that, at some future day, that country he speaks of will be the bee Eldorado of the world. As there is considerable money in raising alfalfa, all the available land in that section will be set to this plant of the desert.

There is a long strip of territory on the east side of the Sierras, which extends from the northern boundary of Nevada down into Arizona. Our bee-keeping friend, Mr. John L. Gregg, is located on a continuation of this same belt. All through the Great American Desert, alfalfa would flourish if it could be irrigated, and then, truly, the "desert would blossom as the rose." On the west side of the Sierra Nevada mountains (in Eldorado Co.) it does not yield honey to amount to any thing. On the east side it seems to be the reverse as regards

the secretion of nectar. I suppose the change of climate, atmospheric conditions, and sandy soil are more favorable for honey secretion. Alfalfa flourishes best on sandy soil. It is a pretty sight to see a field of one hundred acres one vast sheet of purple blossoms.

S. L. WATKINS.

Placerville, Cal.

BEE-STINGS VS. RHEUMATISM; ANOTHER VALUABLE TESTIMONY.

I see many statements in GLEANINGS regarding the subject of bee-stings as a cure for rheumatism. I contracted it while in the army, and have been a great sufferer for many years, often being confined to my bed for months at a time, experiencing all the excruciating agony and pain that any mortal could endure. I was given up to die, by the best doctors in eastern Pennsylvania, being reduced to a mere skeleton of ninety pounds. After the doctors forsook me, and had told many of my neighbors that I could live but a few days at most, I, through the intervention of a kind Providence, gradually got better, and in three months I could get out on crutches, and in that condition I lived for six years, when I bought a swarm of bees in the spring of 1883. When the bees showed their temper I could not get away from them very lively, and I received many very severe stings. At one time I came near dying from stings. Oh, but I was sick! I broke out in blotches all over my body, and a numbness came over me so that I could not move my tongue to speak, and for once in my life I was a mute in reality. From that time I have often told my friends (when they speak of my improved condition) that I give the bees the credit of doing what the doctors could not. I am not careful to avoid an occasional sting, and I can walk around comfortably with a cane, and I weigh 196 pounds. I do not claim a complete cure, but I am so much improved over my former condition that I can not help hailing with joy any thing to relieve such terrible suffering as I have endured. *

S. W. TAYLOR.

Harveyville, Pa., Nov. 25, 1889.

BEE-STINGS A POSITIVE CURE FOR INFLAMMATORY RHEUMATISM.

I have read the reports in GLEANINGS about bee-stings as a remedy for rheumatism; and as there are some that claim it cures them, and some that it does not, I thought perhaps my case might interest you a little. I have suffered with the worst kind of what I call inflammatory rheumatism at different times for over fifteen years. Sometimes it would be two months when I could scarcely turn over in bed and could not even bear the bed clothes to touch the limb that was bad. My knees and ankles and feet were the most affected. It would commence in one joint, and get so bad that the joint would swell terribly, then all in a second it would ease off, and in about an hour the pain was all gone; then in perhaps another hour it had settled into another joint, and it was as bad as the first one. It would sometimes move three or four times before it had run its course, then I would gradually improve. Some years I would have only one or two spells, and some years I would have three or four, and it was mostly when I caught cold.

About four years ago I commenced to keep some bees, and, of course, I got the allotted number of stings, and now I have been three years without any rheumatism worth speaking about. I have had a slight aching this last rainy weather, but not

worth noticing. My opinion is, that stings will cure some kinds of rheumatism; but I am satisfied that there are more than one kind, and perhaps it will not affect some kinds. Of course, I can not be positive that the stings made the cure. It might be the honey I ate, and that is lots, as I am fond of it. then, again, it might be the change of climate, as I moved from Chicago to this place; but I don't think it is the change, as I have had some of my worst spells since I moved here. If I should have any more bad spells I will give the bees a good chance to annihilate it; and if they do I will let you know.

JOHN HAMMOND.

Buena Vista, O., Nov. 25, 1889.

Friend H., we are exceedingly obliged for your careful and conscientious report. No doubt you are in the right about it, and that there are different kinds of inflammatory rheumatism. The testimony is coming out, however, exceedingly strong on the side of bee-stings.

NOTES AND QUERIES.

We solicit for this department short items and questions of a practical nature; but all QUESTIONS, if accompanied by other matter, must be put upon a SEPARATE slip of paper with name and address.

We had nearly 4 inches of rain in October—the heaviest flood in October since 1849.

Long Beach, Cal., Nov. 4, 1889.

F. J. FARR.

100 BUSHELS FROM 2½ OF SEED.

I purchased 2½ bushels of Japanese buckwheat of you last spring, to sow, and I now have at least 100 bushels of it to sell—a better sample, I think, than that I got of you.

O. D. HACKLEY.

Batavia, N. Y., Nov. 22, 1889.

264 BUSHELS OF JAPANESE BUCKWHEAT FROM 7 ACRES.

We have this day thrashed the Japanese buckwheat raised on 7 acres of land from the first five bushels of seed bought of you. There was 264 bushels.

E. H. HOUGH.

Saybrook, Ohio, Oct. 17, 1889.

435 BUSHELS OF JAPANESE BUCKWHEAT FROM 20 ACRES, AND 625 BUSHELS OF WHEAT, ALL IN THE SAME SEASON.

I harvested 625 bushels of nice fultz wheat from 20 acres of ground. Then I plowed the ground, and sowed it to Japanese, from which I thrashed 435 bushels, making 1060 bushels of grain from 20 acres of land, and I have drilled the buckwheat stubble into wheat again. How is that for Kansas? I also have a good crop of honey. I do not think the Japanese is as good for honey as the silverhull.

Quenemo, Kan., Oct. 18, 1889.

J. H. KENNEDY.

BURLAP OR ENAMELED SHEETS FOR WINTER;
WHICH?

Would you advise using enameled cloth beneath the burlap chaff bag on top of bees, for wintering? Would not moisture condense thereon, and make it unpleasant for them? Would not a double thickness of burlap just above the bees and under the chaff cushion be a good plan?

WM. C. BAKER.

Shanesville, O., Oct. 25, 1889.

[We take off our enameled cloths when or soon after we put on the cushions, and put in their place burlap sheets. One thickness of burlap is sufficient. The enameled cloths are objectionable, for the reason you name.]

TO SAMPLE HONEY IN THE COMB, WITHOUT
MUTILATING.

I have a honey-quill for sampling honey, which will take the honey out of a single cell, of which I have seen no description, although it may be an old thing with bee-keepers. It is this: Take a quill of the right size at the large end; cut off the small end; push it down into a cell; put the thumb over the small end, and it will take out the honey of a single cell.

MARK COFFIN.

Milton, Ky., Nov. 26, 1889.

REPORTS ENCOURAGING.

FROM 50 TO 102, AND 4000 LBS. OF HONEY.

I started in the spring with 50 colonies. I increased to 102, and got 4000 lbs.—3400 of comb, and 600 of extracted. My bees are all in good shape to winter.

Chillicothe, Mo., Nov. 26, 1889.

GEO. W. BABB.

KEEPING BEES FOR RECREATION.

My honey crop is 115 lbs. extracted per colony, spring count. I keep the bees in the heart of the city. How is that for an engineer? I keep them for recreation.

R. B. HOLBROOK.

St. Paul, Minn., Nov. 7, 1889.

FROM 20 TO 34, AND 2380 LBS. OF HONEY.

I started with 20; increased to 34, and took 1520 lbs.—860 comb, and the rest extracted. This is my first year with bees. I am delighted with them. I put them in the cellar yesterday. I owe most of my success to GLEANINGS, which I could not do without.

G. L. HEAD.

La Valle, Wis., Nov. 21, 1889.

FROM 150 TO 240, AND 21,500 LBS. OF HONEY.

I commenced the season with 150 stands for extracted honey, and 8 for comb. I have extracted 21,500 lbs., and have taken 500 lbs. of comb honey, and increased to 240 stands. I kept them in two apiaries 6½ miles apart. I have sold all the honey at an average of 6½ cts. per lb.

ROBT. QUINN.

Shellsburg, Ia., Nov. 25, 1889.

As I have said nothing about my bees this year, here is my report: From 20 colonies, spring count, I secured 660 lbs. of extracted honey, and increased to 35. Honey was gathered from aster; too much wet weather through spring and summer to get any surplus. The honey from aster is splendid to winter on. Our winters are very mild. We have no packing to do. We just leave the bees on summer stands as they are.

S. L. KLUTTS.

Clear Creek, N. C., Nov. 15, 1889.

HONEY FROM RED CLOVER.

I put 28 swarms in cellar Nov. 15, 1888; took them out about April 15, 26 of them all right and two dead; no spring dwindling. I increased to 40, and extracted 1900 lbs. and had 200 lbs. of comb honey. The honey was from red clover. I have been noticing for years the reports of honey from red clover; and have also noticed that all the heavy work on it here has been on the mammoth clover, and the first year that it blossoms; after that it does not seem to amount to much for honey.

E. Z. GREEN.

Montague, Mich., Nov. 22, 1889.

FROM 14 TO 26, AND 1200 LBS. OF HONEY.

As far as I can learn, bees have done well around here. I had 14 hives last spring, now I have 26, most of them ten frames full of honey (I have no

extractor). I made over 1200 pounds of nice section honey, nearly all of it white. I had one large swarm come off the last of August. I put it in a nine-frame hive, and it filled and sealed all the frames. I have never known bees to make honey so late in the season, and so clear and white. I have no idea what they gathered it from.

Honey is in small demand here this fall, and but little money to be got on it.

Roseburg, Mich., Nov. 20, 1889. JNO. MITCHELL.

1000 COLONIES ON AN AREA OF FOUR MILES SQUARE.

There are at this time at least 1000 stands of bees here, located on land not to exceed four miles square. I have 204 stands myself in one place.

The sage and wild flowers make this county a bee's paradise; then there is the alfalfa, wheat, and corn they work on; and, in fact, all kinds of flowers. Now for results: I had 120 stands of bees last spring, and I divided about the middle of April to increase to 200. Every thing went nicely for about two weeks. They were making enough honey to live on; but the weather turned cold, and it snowed in the mountains clear down to the valley, on each side of the valley, which is about 15 miles wide here, and kept the weather so cold as to keep the bees in the hives, and about 30 of the divided hives starved before I knew it. The 28th of May, I divided again, and filled them up, and did not put on a super until the middle of June, which is a month later than usual here. Then I got 10,000 sections of nice white honey and 2000 pounds of extracted honey by the 15th of September, and all have enough to winter on. I took from one stand of bees this year, for another person, 254 sections of nice white honey, first class.

If you think this will do for a poor year, the next time you come to California just come down here from Reno, Nev., and see us. HENRY TRICKEY.

Bishops, Cal., Nov. 11, 1889.

REPORTS DISCOURAGING.

HONEY CROP A FAILURE.

Honey in this locality is a failure this year, due perhaps to the excessive rainfall. The usual quantity of pollen was within reach of the bees, and I had much trouble from their storing it in the sections. I should like to know the conditions which give rise to such trouble. We never had this experience before. If any back number of GLEANINGS states the cause, I should like to have it.

Strafford, Pa., Nov. 9, 1889. CHAS. H. HARRISON.

VERY DISCOURAGING—GOING TO BRIMSTONE THE BEES BECAUSE THEY DON'T PAY.

You will have to put me in Blasted Hopes. I commenced last spring with 75 colonies, mostly strong; increased to 83, with 600 lbs. of comb honey; but this is not the worst, for I expect to have to sell for 10 or 12 cts. per lb., for I am informed of a lot of 8000 lbs. which sold for 10 cts. If this is not discouraging, please tell what is. In regard to reports encouraging, I think there are two discouraging to one encouraging, if they could be written up. You say, if one can not keep bees without brimstoning some, they had better go out of the business; but by the time this reaches A. I. Root, some of mine will be dead by its use. NELSON DEWEY.

Adrian, Mich., Nov. 10, 1889.

OUR QUESTION-BOX.

With Replies from our best Authorities on Bees.

All queries sent in for this department should be briefly stated, and free from any possible ambiguity. The question or questions should be written upon a separate slip of paper, and marked, "For Our Question-Box."

QUESTION 150.—*a. Taking one year with another, what is your average honey crop in pounds? and from how many colonies, on the average? State whether for comb or extracted. b. Do you think you would increase or decrease your annual income by keeping more than your present number of apiaries, and employing more help?*

a. 100 pounds of extracted. b. I think we should make more income by keeping more apiaries and employing more help.

Wisconsin. S. W.

E. FRANCE.

a. I think something less than 40 lbs. of comb per colony, from about 200 colonies. b. Yes, if I could get the right help.

Illinois. N.

C. C. MILLER.

Until the past three years it had been 75 pounds, about 25 colonies. We could do better by keeping more. Indeed, we have increased to over 70 now.

Michigan. C.

A. J. COOK.

a. About 80 pounds of extracted, from an average of 100 colonies. b. Different apiaries in different localities would certainly increase the yearly income if they are well attended.

Louisiana. E. C.

P. L. VIALLO.

a. I consider 45 to 50 pounds of comb honey a good average yield, excepting in seasons of failure like the past in this vicinity. b. I think I could increase, but may be I would not.

Ohio. N. W.

H. R. BOARDMAN.

a. About 80 pounds during the past 17 years, with an average of about 45 colonies, spring count. Mostly comb honey. b. Increase by keeping more if I could attend to them myself; but I have too many "irons in the fire" to keep more.

New York. C.

G. M. DOOLITTLE.

a. I can not say. I have not kept a sufficiently careful record for about ten years to state positively. b. Decrease in this locality, with the poor seasons we have had during the past five years. If the apiarian expects a profit, he must do his own work.

Illinois.

MRS. L. HARRISON.

a. I am unable to say. Our last four seasons were too poor to keep a correct account. b. Poor seasons and prices of honey did not encourage myself and neighbors to increase our apiaries. The tendency is the other way.

Ohio. S. W.

C. F. MUTH.

My average honey crop for the last ten years figures about 1580 pounds. My number of colonies in spring has varied from 17 survivors of a winter, when my apiary mostly perished, to 121, when they didn't perish. The average is 77. To establish out-apiaries, and run them by hired help, would evidently run me behind hand.

Ohio. N. W.

E. E. HASTY.

a. I have no means of knowing what my average honey crop has been. Some years none, as in 1887 and '88. This year I have about 30 pounds per colony of surplus, and I guess it might be called comb honey, for it is still in the comb (brood-combs), and

all sealed over. b. That would depend upon the locality and the honey-flow.

Ohio. N. W.

A. B. MASON.

Between forty and fifty pounds per colony, from five hundred to a thousand colonies. Comb honey. We think we are entitled to about fifty pounds as an average, with good swarms. It is very doubtful whether the *net* income would be increased.

New York. C.

P. H. ELWOOD.

a. For the past 10 years my average sales have been about nine tons per year, comb honey, from an average of about 350 colonies. This is averaging the ten years, and is simply an off-hand estimate, as it would take too long to look up the exact figures. b. Yes, possibly for ten years to come, as I am learning more and more about the business every year, and especially how to economize.

Vermont. N. W.

A. E. MANUM.

a. 75 pounds to the hive, with about 300 hives to the apiary, extracted honey. b. If I had abundance of energy to expend I would have more apiaries; but not now feeling capable of looking after things rigidly, I am best off with a small number.

Larger boats may venture more,
But little boats must keep near shore.

California. S. W.

R. WILKIN.

I can not give exact figures for more than a part of the time, but I should estimate my average yield per colony at 45 pounds of comb, or 90 of extracted. This includes the season of 1886, when I did not get a hundred pounds of surplus from my whole apiary, and the very poor season of 1887. This was from an average of about 90 colonies, spring count. I think I could increase my income somewhat by keeping more bees.

Illinois. N. C.

J. A. GREEN.

a. Our average, for 15 years or more, is between 21 and 22 thousand pounds of extracted honey from 350 to 400 colonies. b. Our six apiaries are managed by a single man, excepting a few days when we are in a hurry to put the supers on the hives; then we employ another man; and when we extract we have work for two men and a boy besides our apiarist. We could increase the income by increasing the help and the apiaries, but it would involve more responsibility, and we do not wish to try it.

Illinois. N. W.

DADANT & SON.

a. My average crop for about ten years was a minute fraction over 110 pounds per colony, mostly extracted. In estimating yields, I count all colonies there are in the yard, both large and small, at the commencement of the honey-flow, before any new colonies are made. Number of colonies varied from 30 to 140, and averaged nearly 100. My best average yield was from 108 colonies, spring count. b. Annual income would be decreased unless the number of colonies was increased as well as the number of apiaries.

Cuba.

O. O. POPPLETON.

Our greatest yield from an apiary has been 100 lbs. per colony. Certain colonies ran up to over 200 lbs. Our average yield has been not far from 40 lbs. per colony, for a series of years. Extracted honey, and from 150 colonies. b. It has been our endeavor to increase our colonies, and establish out-apiaries. We have thus far employed but little help to run two apiaries. A very little more help

at the right time would enable us to run two more apiaries, with increased income.

New York. E.

RAMBLER.

I can not answer this question. I have not kept a record. It lies between fifty and a hundred pounds of extracted honey, taking all of the years together, I presume. Where one sells bees, both spring and fall, changing his number of colonies constantly, and raising both comb and extracted honey in the same apiary, as well as increase, unless he keeps a careful record-book it is impossible to answer question a. Question b. is also just as knotty. I know but very little, and believe but very little, in regard to overstocking. As far as the help question is concerned, it would be very profitable to increase the number of colonies, for the cost of help pro rata would decrease. That is one point against out-apiaries; but in regard to overstocking, 21 years' experience is not enough for me. Although I have taken much pains to pump such bee-keepers as I met, who ought to know most about it, I must say I have never yet found one who could shed one clear ray of light on the subject. It is the most obscure problem in bee-keeping, that of overstocking, and yet very much hinges on it.

Michigan. S. W.

JAMES HEDDON.

a. The last four seasons, my honey crop averaged 29,000 pounds extracted and 500 pounds of comb honey, from 250 to 300 colonies, spring count. Four years ago I had only 8000 pounds for my crop, having lost a large proportion of my bees the previous winter. b. How can I tell what I could do till I try? Do you suppose Grant, Lee, Sherman, and other officers in the late war knew what they could do until they tried? Trial proved their capacity to vary greatly. Some were competent to handle 100,000 men or more. The outside limit of others was 10,000, and others proved themselves unfit to handle any. As in war, so in bee-keeping and other pursuits. Capt. Hetherington has proved himself competent to manage a large number of colonies; so did Adam Grimm; so did Harbison, till he found something to suit him better. In my own case I at one time thought of running up into the thousands; but poor health warned me to curb my ambition. At present, had I the strength and inclination, lack of pasture and locations would bar the speculation; for should bee-keepers increase in the future as they have in the past two years it would soon be hard to find an unoccupied field.

Wisconsin. S. W.

S. I. FREEBORN.

Well done, friends. A beginner might well take courage from the above replies. Yet there is, however, a glimpse now and then of blasted hopes. I notice, also, that a good many of the friends have settled down to the idea that they prefer to take life a little easier, even if they do lose some dollars that might be made by shouldering more responsibilities. There is a good point here. I now call to mind quite a few among the bee-friends who have made their lives unhappy and perhaps unprofitable by trying to do too many things, or, if you choose, too much. Better have a little, and do it well, than to attempt great things, and be for ever worried to death, and in hot water all the time. Many of us are a little older than we were fifteen or twenty years ago, and I trust, also, a little wiser. Contentment is better than riches.

Every boy or girl, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock six different books, as follows: viz., *Sheer Off, Silver Keys, The Giant-Killer*; or, *The Roby Family, Rescued from Egypt, Pilgrim's Progress, and Ten Nights in a Bar-Room*. We have also *Our Homes, Part I., and Our Homes, Part II.* Besides the above books, you may have a photograph of our old house apiary, and a photograph of our own apiary, both taken a great many years ago. In the former is a picture of *Novice, Blue Eyes, and Caddy*, and a glimpse of *Ernest*. We have also some pretty little colored pictures of birds, fruits, flowers, etc., suitable for framing. You can have your choice of any one of the above pictures or books for every letter that gives us some valuable piece of information.

GRANDPA'S BEES.

My grandpa has 16 colonies of bees. He has one hive on a large rock. He makes bee-hives. He has a sawmill. He runs the mill by horsepower.

WILL HARRINGTON, age 11.

Setley, Pa., Nov. 28, 1889.

Papa has 45 swarms and 10 Simplicity hives. He has some Italians, blacks, and hybrids. He doesn't like the hybrids very well, but he likes the blacks best. He did lose two swarms. We take GLEANINGS, and expect to for some time.

ELIJAH B. WILSON, age 11.

Blaine, W. Va., Nov. 21, 1889.

AN OLD LADY 94 YEARS OLD.

I was over to Uncle Henry Bixby's. He takes GLEANINGS. My papa lives on a rented farm, and takes care of an old lady. She is the oldest person in the town of Hornby. She is in her 94th year. She reads her Bible without glasses, and she can go upstairs as spry as a cat. I am 11 years old, and love to go to Sabbath-school. Uncle Henry Bixby, as we children call him, is our pastor and superintendent. We all love him.

MATTIE FERRO.

Dyke, N. Y., Oct. 13, 1889.

HOW A BOY MADE HIS BEES PAY.

I am 14 years old; and having a desire to learn the bee-business, last spring I bought a colony of pure Italian bees, for which I paid \$6.00. This season they made 30 pounds of nice comb honey, besides being in good shape for winter. I have sold enough honey to pay for GLEANINGS, and think it is a valuable paper for bee-keepers. I bought your A B C book last spring, and have learned a great deal about bees.

CHAS. V. HOFFMAN.

Sidney, N. J., Nov. 25, 1889.

EARLY-POLLEN GATHERERS.

For five years past I have been writing to you annually, when the bees commenced bringing in pollen. In these five years they commenced about the first of February each year. This year they commenced bringing in pollen on the 16th of January, from the water or white elm. This is a large tree growing on the river, and buds very early. The pollen brought in was of a canary color, and very soft. My pa closed the season with 102 colonies; but after uniting several he went into winter

quarters with 82. These he wintered on their summer stands in Simplicity hives, and protected them from the cold northerly by a high plank wall.

LIZZIE L. MULLIN, age 13.

Oakland, Tex., Jan. 22, 1889.

BEES AND FRUIT; VALUABLE TESTIMONY OF A LITTLE GIRL.

We saw in your journal that some think the bees eat the grapes; but my pa does not think they do, unless the little ruby-crown kinglet bird makes a tiny little hole in them. We have 75 hives of bees, and have sold six tons of grapes. We have a large peach and apple orchard, and the bees do not disturb them.

MARCIA HOPKINS, age 11.

Brownhelm, Ohio, Oct. 20, 1889.

LILLIE REPORTS A GOOD YIELD; WHITE FALL HONEY.

We got from 35 colonies, spring count, about 6000 lbs. of honey this year, and increased to 70. The clover season lasted about two months before linn bloomed. After the linn and clover were gone we had a good crop of fall honey. There were about 10 hives of comb honey that were partly filled before the fall flowers bloomed, and we did not take the honey off from them until October, and it was as white as the clover honey that we got in June. Is it possible that they could have finished them with any thing but smartweed, Spanish needle, and the other fall flowers? We have the Syrian bees, and have not been troubled with robbers this fall, as usual, but we have had one or two stolen.

LILLIE GRAHAM, age 13.

Agency, Mo., Oct. 28, 1889.

Friend Lillie, it is hardly possible that Spanish needle or other ordinary fall flowers furnished light honey. Smartweed might come a little nearer to it, but I am inclined to think your light honey came from red clover—that is, if there is any in your vicinity.

A REPORT FROM A GERMAN APIARY; CAN WE WINTER ON THE ROOF OF THE HOUSE?

To-day papa is hauling bees. They have done very poorly this year, and in one of our out-apiaries we had some of the honey and bees stolen. It seems we had hard luck with bees this year. Some of our swarms got lost. Of August swarms we had plenty, but they all went to the woods. In another out-apiary we lost about one-third by moths and poor fields. Our last report from Germany says it looks far better there. Hives are all full, both straw and wooden hives. Buckwheat and heather have had good weather, and our bees are in the middle of both. This winter papa is going to put his bees on the roof, as our home apiary is too small, on account of new buildings. I should like to know about wintering on the roof in well-packed chaff hives. We have tried a few last winter with success. Papa doesn't like cellar wintering, as we live in the city.

ANNA BLANKEN, age 12.

Jersey City, N. J., Oct. 24, 1889.

Friend Anna, bees could probably be wintered quite successfully on the roof in Jersey City. Friend Muth, in Cincinnati, has wintered his so, for years, quite successfully. I should prefer to have them on the roof of a wing of a house, so that the taller portion, or the house proper, might extend higher, and keep off the north or west winds.

OUR HOMES.

He that is slow to anger is better than the mighty; and he that ruleth his spirit than he that taketh a city.—PROV. 16: 32.

DECEMBER 7 was a beautiful sunny day; in fact, it seemed more like April or May than December; but at the Home of the Honey-bees we were exceedingly anxious that it should be a fine day.

The foundation for our large reservoir was already finished, upon the hill near the factory. The staves for the great tub were piled up close by. The windmill, pump, and other machinery, were all in readiness, and the man was expected on the morning train to "boss the job" of putting the machinery in place, and rearing the whole structure. We telegraphed him to come the day before; but as it was rainy we did not feel very bad when we found that he did not come. When the sun, bright, clear, and warm, shone out on the day in question, however, we felt very anxious. Our people are all interested in the matter, and the workers in wood, metals, dirt, brick, stone, etc., were almost as anxious as I to see this individual who travels from place to place bossing the erection of such structures. Sure enough, he got off the train. After a few brief questions he told the carpenters what to do; then the masons were set at work; then the ditchers commenced in the trenches, to put in the great wooden pipes, down out of the way of frost, and all worked with a will.

I now wish to digress from my story a little right here, to consider this matter of bossing others, or, if you choose, of taking charge of a number of men. It comes a good deal in the same line as taking charge of out-apiaries—having several apiaries instead of one. How is it that some have a gift in that line, and others have not? The man who came to put up our waterworks receives four dollars a day, and all expenses. There is nothing about him at first sight to indicate that he is much more than a common day laborer; but the great firm of Fairbanks, Morse & Co., who put up such works, and guarantee them against leakage, etc., gave him an excellent recommendation. They said, that whatever work he put up never had to be done over afterward. This is a great thing, I grant, and I watched our new friend anxiously to see how he had earned this high reputation. I soon discovered that it was almost altogether in giving his personal supervision to every little point. I presume he has usually two or three men to help him—possibly four. Here at the Home of the Honey-bees we are in the habit of setting a dozen, or perhaps thirty or forty at work all at once. This man insisted on doing every thing himself, pretty much. His helpers are simply waiters. They handed him the tools, and held the pieces while he drove the nails or turned the bolts. He was not satisfied unless he had the wrench in hand and tried every nut and bolt before he left it. With the years of experience he has had in putting up similar structures, and perhaps in repairing faulty ones, he

knew just where to expect something to give way. He never broke a bolt or bursted a joint by turning it too hard; but every thing was turned up just about as far as the strength of metals or wood would allow. He never said, "I guess that will do well enough," and let it go. If a bolt turned in its place, or if a nut slipped a thread, it had to be taken out, and a new one put in its place. Undertaking such kind of work in December was exceedingly risky, and I was very anxious indeed to have the whole arrangement moving at once, from the factory clear to the top of the reservoir and windmill tower. I am so much in the habit of being "boss" of every thing on the premises, it tried me exceedingly to be obliged to await the movements of a single individual. I could have my choice, it is true; but if he did not have every thing just as he wanted it, the company would not be responsible for a failure of some part of the work. It was quite a cross for me to bear; but, dear friends, it did me good. It was just the discipline I needed, pretty nearly if not quite in a line with the above thought in our text. Now, in our work here, no one is ever idle. Strangers who come here to work are often a good deal surprised, and sometimes feel hurt, because they are told that nobody ever need wait for somebody else during working hours. A few days ago a friend of mine hired three men to come and help him thrash. The machine did not get along, and so they sat down and loafed the whole half-day, waiting for the machine to come, and he had to pay them full wages. I have never done such a thing in my life. I would have told those men to pick up stones from the field, gather up rubbish and cut it into firewood, dig ditches, slick up the yard, pull weeds, straighten water-courses, fix the fences, straighten up the underpinning under buildings before it gives out, or something of that sort. I do not believe that I ever saw a homestead where I could not set half a dozen men at work profitably for half a day or several days—that is, more profitably than to sit still and wait for somebody else. Very likely I have a special gift in this direction.

As this is a matter of exceedingly great importance to most of our readers, I wish to digress still a little further to tell you how I learned it. It came about principally in the effort to find employment for people whom I wished to benefit. To come right to the point, I think I may say, because I wished to bring them to Christ Jesus. I have taxed my wits and my abilities day and night, for perhaps twenty years, in this direction. Sometimes, by an unexpected occurrence, three, four, or half a dozen men are stopped in their work, and they come to me. Perhaps others are waiting for me besides. My plan is this:

I first say, "Boys, just stand right still, just a minute; don't go away, any of you, until I give you leave. Here, George, you pick up stones over in that field."

"All right," says George; "but where shall I put them?"

"Put them in little heaps until I get ready to tell you. Willie, go to the fruit-

house and get a wheelbarrow full of potato-boxes. Get the oldest ones you can find. Fred, get a hoe and give the asparagus a most thorough cleaning-out. Do it so I can't find a weed nor a blade of grass. Now look sharp, and don't skip any. Mr. W., take your spade, and look out for the outlet to all the underdrains. See that they are exactly as they ought to be," etc.

Now, I know by experience that most of them—perhaps all of them—will misunderstand, and must be looked after. The one who went to picking up stones, will, if he is a small boy, perhaps spend time in picking up stones so small that they do no harm. He must be furnished a sample, and told not to go under that size. The boy who is to clean out the weeds may waste time in looking for a tool, and perhaps he would get the wrong patch. The one who went after the boxes must be told what to do next when he comes back. Very likely Mr. W. was not with us when the underdrains were all located, and therefore will not find the outlets without showing. So I hurry around from one to another, meanwhile reviewing the work to see if there is not something of still more importance than that which the boys were started at hastily. At such times I almost always find something or other that was in very great need of attention, so nothing is lost. Now, my friend, you may think it a little strange, but I have, by years of experience, learned to set over a hundred people at work in just this way, and not only manage it all profitably, but I enjoy it; yes, it gives me a kind of happiness that I can not find otherwise, and that I enjoy almost as much as any thing else in this world, furnishing my friends and neighbors the wherewith to earn their daily bread by honest, ennobling toil. Of course, I commenced on a small scale. At first I had one man to help me. When we two could lay up money, a third was called in, and so on. You may say, we can not all do this kind of work. True; but there is an unceasing demand—a constant and increasing unfilled want for men who can boss others. Now, then, you can never make any progress at all in this line until you can rule *self*. This new friend I have been speaking of does his work a great deal better than I do. It would hardly be safe to trust me with an important work of engineering where much money and may be human life depended on the result. In fact, I learned long ago not to trust my judgment and experience alone in such matters. Able and experienced mechanics in wood, stone, earth, and metals, are my companions; and it would be folly for me to rush stubbornly against their better judgment. Sometimes we hold counsel, or call in the aid of mechanics, machinists, etc., but I am always troubled and worried to find that these careful, high-priced men, let those under them waste time. Sometimes expensive men are kept on hand, even though they work less than half of their time. I am told that there is no other way. In almost every department of knowledge, science, art, and industry, I come every little while to the point where I long for something more than

human. I want great accuracy, combined with an ability to look after a great number of people all at one time. Very likely these two qualifications never existed in any single individual; but by putting a good many heads together, however, we accomplish what no one man ever could accomplish. And may God be praised that it is so! We are dependent upon one another, and if we do not work together with a cheerful and friendly good will we shall never succeed in doing great things. Now, then, friends, with your permission we will go back to our story of that bright sunshiny December morning. It needed your old friend, A. I. Root, at almost every turn, to tell the builder just what his ideas were, and how he would like to have things arranged. For instance, some bolts were wanted that we did not expect to need, and so a boy had to go half a mile after them. The ditchers, too, needed a little caution. They were digging the trenches wider than they needed to be, thus throwing out dirt uselessly. Lumber was wanted from the planing-mill; somebody could not find the tool he wanted; several things at the factory needed looking after, for John and Ernest were both attending the national convention at Brantford. One or two new hands had made their appearance, and wanted to be shown where they were to work. Before noon the printers wanted copy, or instructions in regard to it, that must be seen to personally by A. I. Root, in the absence of Ernest, the assistant editor. I went through it all pretty well, however, until symptoms of waning strength began to remind me that it was time for my noonday nap. I looked at my watch, and I found that, if I made a bee-line for my accustomed lounge, I should have just time to make it. The day was so fine, and so many things needed my personal attention, that it seemed almost folly to think of going off to *sleep* when everybody was so busy, and in so much danger of going wrong if I did not happen to be within hailing distance. I remembered, however, that I should not only suffer during the half-hour that has so long been set aside for my accustomed nap, but I knew I should be unfit for clear and cool judgment all the afternoon. I have tried it repeatedly; but unless I have my noonday nap I feel about as most of you do who have been kept awake all night long. The plain, wise thing to do was to drop business and seek rest. Quite a few got in my way. Some wanted employment; others wanted to hinder me with idle, unimportant questions; and as I almost reached my home I became quite nervous and fidgety. Some little girls were coming along the walk, but I felt too much exhausted and used up to feel capable of giving them even the smiling and pleasant "good-morning" that I knew I ought to give. I was in a hurry, for the minutes were precious. At such times when I am pushing blindly ahead for my lounge, even a *quarter of a minute* seems a hindrance. I long to be out of sight, and away from everybody, where I need not even *smile* unless I feel like it. Now, do not imagine, dear friends, that at such times I feel par-

ticularly cross. I feel kindly and pleasantly toward everybody; but, oh, how I do wish to be just let alone! A good old lady who lives in the neighborhood has sometimes tried me exceedingly by insisting on replies in regard to the weather, the state of the roads, etc. Why, I have actually left the sidewalk and pushed off through the apiary, simply to be excused from talking, or using my brains when they were already *used up*. Well, I pushed away over to the opposite side of the walk, that I might let the little girls pass, without slacking up my rapid footsteps. One of them was accompanied by a little yellow dog. At sight of me, with my rapid movements, he seemed to think it incumbent upon his dogship to bark and growl; and when I stepped clear off the walk to evade him, he flew at me, snapping and snarling, and, in spite of all I could do, he grabbed me by the leg and bit me quite severely, although he did not draw blood. I tried to kick him, but he was too adroit, and I was too tired to use much strength. I made up my mind that any dog that thus molests peaceable passers-by ought to be killed, and so I looked for a stone or stick to put my "project" into execution. The dog watched me as closely as I watched him; and, probably noticing that I could not find any particular stone, he attempted to bite me again. I have sometimes said that I never wanted a pistol. Just then it occurred to me that such an implement would be *exceedingly* convenient. Ernest has a shotgun, but he was away, and his house was locked up. Uncle Hen, also, has one to kill rats; but I could not see him anywhere in sight. It would have been a real luxury just then to offer somebody a five-dollar bill to make sure work of that obnoxious "yaller dorg." Just then it occurred to me, "Look here, old friend A. I. Root, it strikes me you are considerably stirred up. Hadn't you better cool off a little?" I did not say any thing out loud, but I said to myself, "The good of passers-by and community at large demands that that dog be killed."

"Very likely it does; but the minutes are passing. Which is of the most importance—that you have your nap, and the clear mental vision that will come after it, or that you set the little girls to weeping by killing their pet dog—that is, if you are *smurt enough* to get him killed by using up your whole half-hour of rest?"

I looked—was it viciously or wistfully?—toward the dog. I made some big resolutions as I gave him a farewell glance while he went off wagging his tail. I succeeded in gaining my coveted place of rest and retirement, but I was too much stirred up to get to sleep. The little voice resumed:

"Look here, my friend; do you expect to get to sleep when you are vehemently planning ways and means of putting that dog out of existence? Why trouble yourself by rehearsing what you will say to the owner when you meet him after dinner? and, my friend, how does your present mood harmonize with the little text you are in the habit of thinking over and over, as you loose consciousness?"

I will both lay me down in peace, and sleep; for thou, Lord, only makest me dwell in safety.

Then came the thought, "It is a bigger task than I am equal to." By and by another text followed, something in that line:

I can do all things through Christ which strengtheneth me.

The twinges in the calf of my leg where the dog bit me still tended to rouse combative feelings, and for a little time I feared I was not going to make the desired haven. Then I remembered the time when I "laid me down in peace to sleep," when the factory warehouse was burning. "Shall a poor mistaken yellow dog spoil my usefulness, spoil my temper, and spoil my rest during this bright day when so many responsibilities are resting on my shoulders, and when I am needed so much?" Then came thoughts in the line of that beautiful little text, at the head of our talk to-day:

He that is slow to anger is better than the mighty; and he that ruleth his spirit than he that taketh a city.

And I conquered the bad spirit. I slept, and woke up just as the whistle was blowing, refreshed in mind and body, and with praise and thanksgiving in my heart. If fifteen minutes of sleep can work such a miracle to others who are subject to nervous exhaustion, I shall do good service in urging upon tired and exhausted humanity this God-given remedy—this plan of invigorating without medicine. When I glanced at the hill as I hurried toward the factory, one of the staves of the great tub was raised aloft, clearly and sharply defined against the blue sky. Before I had passed the hundred yards between my residence, and the factory where the notes of the organ proclaimed the noon service begun, three more staves were placed beside the first one, and I felt happy, and for several reasons. I had ruled the spirit that would do me harm. It may not have been a very evil spirit, it is true; but it was one that would have unfitted me for my task had I listened to it; and I felt happy, too, to think that the better spirit had triumphed—that A. I. Root had effectually, calmly, and coolly and deliberately *ruled*, and not a sudden impulse. Do you wish, dear reader, to know the fate of that yellow dog? Well, so far as I know he still goes about on four legs; but I hope not, however, abusing people who are attending to their own affairs on their own premises, as he abused me. I still think, however, that he and all of his race that have *that* disposition should be abolished from—sidewalks. May be they ought to be extinguished completely from the face of the earth. If a majority of the community should so decide, all right; but in handling all these questions we should remember there a multitude of tastes to consult. Dogs have seemed to me to be a rather useless appendage to society, therefore I am not a fit one to judge. I have not yet spoken to the owner of the dog, neither do I know the laws of our land in regard to cases of this sort. This I do know, however, that whatever needs to be done should be done in a line of the littletext which says, "If it be

possible, as much as lieth in you, live peacefully with all men."

The big reservoir is now finished, and over it the windmill spreads its wings, almost ready to commence its task of keeping the great tank constantly full. It stands against the sky "a thing of beauty," and I hope it may prove to be "a joy forever" to the community round about it. We have already been discussing placing upon it in great letters, so that they may be read for half a mile or more, the little text that has been so much a favorite of mine for a few months past: "Not to be ministered unto, but to minister." One of the friends has suggested another good one, if it were not so long, to be written in great letters between the hoops: "Whoso drinketh of this water shall thirst again; but whoso drinketh of the water that I shall give him, shall never thirst."

GLEANINGS IN BEE CULTURE.

Published Semi-Monthly.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, OHIO.

TERMS: \$1.00 PER YEAR, POSTPAID.

For Clubbing Rates, See First Page of Reading Matter.

MEDINA, DEC. 15, 1889.

Seest thou a man diligent in his business? he shall stand before kings; he shall not stand before mean men.—PROV. 22, 29.

AN ERROR IN DISTANCE.

Our good friend M. H. Hunt, of Bell Branch, Mich., calls my attention to the fact that I stated that he lived four miles from the depot, whereas he is only two and a half miles away. As some of his customers might think he did not tell the exact truth in his catalogue, I make the correction and beg pardon.

TILLINGHAST'S FLORAL ALBUM.

THIS is a beautiful collection of chromos of all of the principal flowers in cultivation, including most of the honey-plants, and all in their natural colors. To those who wish to know what our honey-producing flowers look like, and to be able to identify them at a glance, it should be worth a good deal. See advertisement in this issue.

CHRISTMAS PRESENTS.

WE present, along with this number, to all our readers, with compliments of the season and our best wishes for the new year, a Christmas souvenir in the form of a 16-page picture-gallery. We have not yet reached the 10,000 mark, and we trust this souvenir will be a reminder to our many friends to make an extra effort to get their share of the number of names necessary to make it 10,000 by Jan. 1, and thus return the compliment.

A NEW PRESS FOR GLEANINGS.

ABOUT the first of February, GLEANINGS will be printed on a brand-new 16-page Campbell oscillator book-press. Our old one has been obliged to run

almost night and day for several weeks, and we concluded that we should have to have something that would do the work more rapidly, or else decrease our subscription list. The press is the latest in design, and is the best book-press we could purchase. It will cost \$2500. We are aiming at the highest perfection in the printer's art; and while we are not at all ashamed of our past record as printers, we hope to do even better.

THE NUMBER OF PAGES IN A VOLUME OF GLEANINGS.

THE present volume scores 1024 pages. We shall probably do the same, or perhaps better, next year. We call the attention of our readers to our large index of illustrations, and also to the topical index. We have left out our usual index of correspondents, as we thought it to be the least valuable of the three. It takes an immense amount of labor and painstaking care to get it out; and we believe our readers will prefer the same energy expended in other departments of the journal.

FIRST-CLASS POULTRY WANTED.

WE are having quite a good many inquiries, especially of late, in regard to fine poultry. Letters read something like this: "Mr. Root, could you furnish me a nice pair of Plymouth Rocks? If not, please give me the address of some good man." Somebody else wants Light Brahmas, and so it is with the other standard breeds. Now, if I should undertake to sell poultry with all the other business I have, I might go crazy; therefore I should like to have some poultry-breeder among our bee-folks keep a small standing advertisement in GLEANINGS. It seems to me that the business ought to pay, with the prices poultry-breeders seem to be getting. I picked out a trio of Light Brahmas at our county fair, that suited me very well. But what do you suppose the owner wanted for them? Only \$6.00!

DELUGING EDITORS WITH FACTS ABOUT COMB HONEY.

SOME time ago the Chicago *Herald* repeated the old comb-honey slander; namely, that about comb honey manufactured artificially, filled with glucose, and capped over with appropriate machinery. Brother Newman wrote them a very courteous and gentlemanly letter, pointing out their mistake. We also wrote them, forwarding one of our \$1000 reward cards. It seems, also, that bee-keepers from all points of the compass deluged the editor with letters. The *Herald* for Saturday, Nov. 23, finally comes out with a long article on bees and their work, giving some facts in regard to the honey-business, how foundation is made, etc., although it clings to the idea that the liquid article is adulterated to a certain extent. It says, after the first statement appeared in the *Herald*, in regard to adulterated or manufactured comb honey, it "was at once inundated with a flood of letters from bee and honey men, who declared that honey-comb can not be made, filled with honey, and sealed with appropriate machinery so as to escape detection in the market; and," it says, "this statement is doubtless true." Right here is a very suggestive fact: There is nothing in the world that will have such an effect upon editors who have misrepresented our industry as to deluge them with letters, not from editors of bee-papers alone, but from the subscribers themselves. A flood of letters from bee-keep-

ers far and wide will have vastly more effect than letters from two or three editors of bee-papers alone. We hope our subscribers will remember the hint, and deluge the next offending paper.

CRAZY EDITORS.

It is the editor of GLEANINGS IN BEE CULTURE I have in mind, and not that of any other periodical. This crazy editor, after publishing a pretty fair journal for almost 17 years, toward the close of the 17th year it seems has got into a fashion of attaching an answer intended for one correspondent to an article written by another one. The first appeared in our issue of Nov. 15, at the end of friend Manum's article. The boss printer said he wanted about so many inches of matter to fill up a given space. I understood him—or at least I got it into my head—that the space was after friend Boardman's article entitled "A Model Bee-yard," therefore I gave the printers the required amount of copy for the matter in view. Turn to page 886, and read the last half of my reply to friend Manum, and you will understand it. In the same issue, on page 893, is a short item, headed "Rat-tailed Maggots." I dictated a reply to this, which, for some reason or other, did not show up on the printed page. It, however, does show up, greatly to our consternation, at the end of Prof. Cook's excellent article on cuckoo-bees, page 947. It is not such a terrible matter, it is true, but it gives one who turns the pages of GLEANINGS an impression that its editor has his head filled with reservoirs, windmills, or something else, besides the business in question. We hope that at least 16 years more may pass before we ever have occasion to make such a lengthy apology again, at least in this line.

The foot-note to the article on cuckoo-bees should have read as follows:

Friend Cook, you say these strange intruders are only males and females. Now, a host of perplexing questions come in here. Is every female a queen? If so, who shall fix the limit of their increase if they fill up hives with brood, and the bees take care of them? Do the males and females meet in the open air, as do honey-bees? and if they winter over in the hive, why do they not continually occupy all of the available cells with eggs? Very likely, where every worker-bee is a queen they are not all as prolific as a honey-bee queen—at least we hope not. It seems to me, however, that it must be that our honey-bees recognize them sufficiently to be able to make, at least to a certain extent, some resistance against their encroachments; for if they do not, what is to hinder the colony from being ruined at once?

Friend Cook writes as follows:

Don't worry about the mistake in GLEANINGS. We enjoy seeing that you occasionally make mistakes. It makes us feel more akin. A. J. COOK.
Agricultural College, Mich.

CONVENTION NOTICES.

The Erie Co., N. Y., Bee-keepers' Association will hold its next meeting in Concert Hall, Holland, 10 A.M. and 1 P.M., Dec. 18, 1899. An interesting programme is provided.
South Wales, N. Y. MRS. CHAS. FAVILLE, Sec.

The 21st annual meeting of the New York State Bee-keepers' Association will be held at the Court house, Rochester, N. Y., Feb. 5, 6, 7, 1899. Reduced rates at hotels, and on all principal railroads. Each county association is requested to send two or more delegates. Programme and full particulars will appear in due time.
G. H. KICKERBOCKER, Sec.

The 24th annual meeting of the Michigan State Bee-keepers' Association will be held at Lansing in the capital building, Dec. 26 and 27, 1899. Reduced hotel rates at the Hudson House. Half fare on nearly all railroads. A few charge one and a third fare for the round trip. All are cordially invited.
Clinton, Mich. H. D. CUTTING, Sec.

The next annual meeting of the Ontario Bee-keepers' Association will be held in the City Hall in the city of Belleville, Ont., on the 8th and 9th of January, 1899.
W. COUSE, Sec. O. B. K. A.

The next annual meeting of the Vermont Bee-keepers' Association will be held at Burlington, Vt., Jan. 21, 22, 1899. Excellent hall accommodations have been obtained at the Van Ness House. The Vermont Central Railroad has granted round-trip tickets from the following places: Rutland, White River Junction, Cambridge Junction, Richford via St. Albans, Thion deroga, and intermediate points, to Burlington and return, for fare one way. A good meeting is expected, and all are invited. For further information and programmes, apply to
J. H. LARRABEE, Sec'y.

Larrabee's Point, Addison Co., Vermont.

TOBACCO COLUMN.

CONDITIONS UNDER WHICH WE GIVE SMOKERS TO PERSONS WHO STOP USING TOBACCO.

First, the candidate must be one of those who have given up tobacco in consequence of what he has seen and read in this department. Second, he promises to pay for the smoker should he ever resume the use of tobacco in any form, after receiving the smoker. Third, he must be a subscriber to GLEANINGS. Any subscriber may, however, have smokers sent to neighbors or personal acquaintances whom he has labored with on the matter of tobacco-using, providing he give us his pledge that if the one who receives the smoker ever uses tobacco again, he (the subscriber) will pay for the smoker. The one who receives the smoker in this case need not be a subscriber to GLEANINGS, though we greatly prefer that he be one, because we think he would be strengthened by reading the testimonials from time to time in regard to this matter. The full name and address of every one who makes the promise must be furnished for publication.

I am endeavoring, in a quiet way, to arouse the parents of school children to the dangerous and deadly effects of the tobacco habit, in order to have them demand of the school boards that they enact and enforce such rules and regulations as will effectually prohibit the handling and use of tobacco upon the school grounds, and the refusal to hire or employ, as teachers, persons addicted to the use of tobacco. "Children are the seed corn of the State," and every good citizen should feel called upon to guard and protect them during the tender years of indiscretion and thoughtlessness against tobacco and strong drink. Your name has been furnished me as an unselfish patriot, a lover of humanity, and one pledged to the reformation of evil and vicious habits. I sincerely trust you will lay your ax at the root of the crying sin of this country, and enlist the educators and philanthropists of Ohio in extirpating the tobacco habit from the public schools of Ohio.
J. B. PRICE.

Jefferson City, Mo., Nov. 3, 1889.

GOING SECURITY.

Please send one of your smokers to Mr. S. A. Miller, Cantril, Iowa; and if he breaks the rules, I will agree to pay for the smoker.

Cantril, Ia., Aug. 6, 1889. ANNIE K. MILLER.

One of my neighbors has quit using tobacco after using it 35 years. If you send him a smoker, I will pay for it if he uses it again. JOHN MCCARTHY.

Madelia, Minn., May 18, 1889.

I have stopped the use of tobacco in all ways and I advise others to stop it. I don't want a smoker, for I have one. O. W. JEFFERSON.
Acme, Mich.

I have been a great slave to tobacco for the last ten years; but by the help of God and a sample copy of GLEANINGS I quit the use of it nearly one year ago; and if you will send me a smoker for my pledge I will pay you for it if ever I use tobacco in any way again. A. J. HUSKEY.

Ingletton, Ala., June 6, 1889.
